

$$\begin{aligned}
&\text{Slope of secant line between } (x_1, f(x_1)) \text{ and } (x_2, f(x_2)) \\
&= \text{average rate of change} \\
&= \frac{f(x_2) - f(x_1)}{x_2 - x_1} \\
&= \frac{\Delta f(x)}{\Delta x}
\end{aligned}$$

where $\Delta x = \text{change in } x = x_2 - x_1$

and $\Delta f(x) = \text{change in } f(x) = f(x_2) - f(x_1)$

Slope of tangent line to f at $x_1 = \text{instantaneous rate of change}$

$$\begin{aligned}
&= \lim_{x_2 \rightarrow x_1} \frac{f(x_2) - f(x_1)}{x_2 - x_1} \\
&= \lim_{x_1 + h \rightarrow x_1} \frac{f(x_1 + h) - f(x_1)}{x_1 + h - x_1} \\
&= \lim_{h \rightarrow 0} \frac{f(x_1 + h) - f(x_1)}{h}
\end{aligned}$$

Definition $f'(a) = \text{slope of tangent line to } f \text{ at } a = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$.

If $f(x) = 2x - 4$, then $f'(8) =$

If $g(x) = 3$, then $g'(1) =$

If $h(x) = |x|$, then $h'(5) =$

and $h'(-5) =$

Definition: Given f , then define the function f' (the derivative of f) as follows:

$$f'(x) = \text{slope of tangent line to } f \text{ at } x = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}. \blacksquare$$

x is in the domain of f' if x is in the domain of f and the above limit exists.

If $f(x) = 2x - 4$, then $f'(x) =$

If $g(x) = 3$, then $g'(x) =$

If $h(x) = |x|$, then $h'(x) =$

Suppose $f(x) = -2x + 12$ represents the distance traveled from home in miles after x hours. Find the average velocity between $x = 1$ and $x = 3$. What are the units?

Find the instantaneous velocity at $x = 1$: What are the units?

Suppose $f(x) = -2x + 12$ represents the cost of stock after x days from purchase. Find the average change in the cost of the stock between $x = 1$ and $x = 3$. What are the units?

Find the instantaneous change in the cost of the stock at $x = 1$: What are the units?

Suppose $f(x) = 8$ represents the distance traveled from home in miles after x hours. Find the average velocity between $x = 1$ and $x = 3$. What are the units?

Find the instantaneous velocity at $x = 1$: What are the units?

Suppose $f(x) = 8$ represents the cost of stock after x days from purchase. Find the average change in the cost of the stock between $x = 1$ and $x = 3$. What are the units?

Find the instantaneous change in the cost of the stock at $x = 1$: What are the units?

Suppose $f(x) = \frac{x+3}{4x-5}$ represents the distance traveled from home in miles after x hours. Find the average velocity between $x = 1$ and $x = 3$. What are the units?

Find the instantaneous velocity at $x = 1$: What are the units?

Suppose $f(x) = \frac{x+3}{4x-5}$ represents the cost of stock after x days from purchase. Find the average change in the cost of the stock between $x = 1$ and $x = 3$. What are the units?

Find the instantaneous change in the cost of the stock at $x = 1$: What are the units?
