Euler Inner Product and Semi-stability

Given a quiver Q with vertex set Q_0 and arrow set Q_1 , we define the **Euler inner product** of two vectors α and β in \mathbb{Z}^{Q_0} to be

Euler Inner Product and Semi-stability

Given a quiver Q with vertex set Q_0 and arrow set Q_1 , we define the **Euler inner product** of two vectors α and β in \mathbb{Z}^{Q_0} to be

$$\langle \alpha, \beta \rangle = \sum_{i \in Q_0} \alpha(i)\beta(i) - \sum_{a \in Q_1} \alpha(ta)\beta(ha)$$

Euler Inner Product and Semi-stability

Given a quiver Q with vertex set Q_0 and arrow set Q_1 , we define the **Euler inner product** of two vectors α and β in \mathbb{Z}^{Q_0} to be

$$\langle \alpha, \beta \rangle = \sum_{i \in Q_0} \alpha(i)\beta(i) - \sum_{a \in Q_1} \alpha(ta)\beta(ha)$$

From now on, assume that Q is a connected acyclic quiver.

Euler Inner Product and Semi-stability

Given a quiver Q with vertex set Q_0 and arrow set Q_1 , we define the **Euler inner product** of two vectors α and β in \mathbb{Z}^{Q_0} to be

$$\langle \alpha, \beta \rangle = \sum_{i \in Q_0} \alpha(i)\beta(i) - \sum_{a \in Q_1} \alpha(ta)\beta(ha)$$

From now on, assume that Q is a connected acyclic quiver.

Let $\alpha \in \mathbb{Q}^{Q_0}$.

A representation $V \in \text{rep}(Q)$ is said to be $\langle \alpha, - \rangle$ -semi-stable if:

$$\langle \alpha, \underline{\dim} V \rangle = 0 \text{ and } \langle \alpha, \underline{\dim} V' \rangle \leq 0$$

for all subrepresentations $V' \leq V$.

Euler Inner Product and Semi-stability

Given a quiver Q with vertex set Q_0 and arrow set Q_1 , we define the **Euler inner product** of two vectors α and β in \mathbb{Z}^{Q_0} to be

$$\langle \alpha, \beta \rangle = \sum_{i \in Q_0} \alpha(i)\beta(i) - \sum_{a \in Q_1} \alpha(ta)\beta(ha)$$

From now on, assume that Q is a connected acyclic quiver.

Let $\alpha \in \mathbb{Q}^{Q_0}$.

A representation $V \in \text{rep}(Q)$ is said to be $\langle \alpha, - \rangle$ -semi-stable if:

$$\langle \alpha, \underline{\dim} V \rangle = 0 \text{ and } \langle \alpha, \underline{\dim} V' \rangle \leq 0$$

for all subrepresentations $V' \leq V$.

Likewise, it is $\langle \alpha, - \rangle$ -stable if the inequality is strict for proper, non-trivial subrepresentations.

Schur Representations and Generic Dimension Vectors

Recall that a representation V is called **Schur** if $\text{Hom}_Q(V, V) = K$.

Schur Representations and Generic Dimension Vectors

Recall that a representation V is called **Schur** if $\text{Hom}_Q(V, V) = K$.

We say a dimension vector β is a Schur root if there exists a β -dimensional Schur representation.

Schur Representations and Generic Dimension Vectors

Recall that a representation V is called **Schur** if $\text{Hom}_Q(V, V) = K$.

We say a dimension vector β is a Schur root if there exists a β -dimensional Schur representation.

We say that $\beta' \hookrightarrow \beta$ if every β -dimensional representation has a subrepresentation of dimension β' .

Semi-Stability

$\text{rep}(Q)_{\langle \alpha, - \rangle}^{ss}$ is the full subcategory of $\text{rep}(Q)$ whose objects are $\langle \alpha, - \rangle$ -semi-stable.

Semi-Stability

$\text{rep}(Q)_{\langle \alpha, - \rangle}^{ss}$ is the full subcategory of $\text{rep}(Q)$ whose objects are $\langle \alpha, - \rangle$ -semi-stable.

We say that β is $\langle \alpha, - \rangle$ -(semi)-stable if there exists a β -dimensional, $\langle \alpha, - \rangle$ -(semi)-stable representation. This is equivalent to saying

Semi-Stability

$\text{rep}(Q)_{\langle \alpha, - \rangle}^{ss}$ is the full subcategory of $\text{rep}(Q)$ whose objects are $\langle \alpha, - \rangle$ -semi-stable.

We say that β is $\langle \alpha, - \rangle$ -(semi)-stable if there exists a β -dimensional, $\langle \alpha, - \rangle$ -(semi)-stable representation. This is equivalent to saying

$$\langle \alpha, \beta \rangle = 0 \text{ and } \langle \alpha, \beta' \rangle \leq 0 \text{ for all } \beta' \hookrightarrow \beta$$

Semi-Stability

$\text{rep}(Q)_{\langle \alpha, - \rangle}^{\text{ss}}$ is the full subcategory of $\text{rep}(Q)$ whose objects are $\langle \alpha, - \rangle$ -semi-stable.

We say that β is $\langle \alpha, - \rangle$ -(semi)-stable if there exists a β -dimensional, $\langle \alpha, - \rangle$ -(semi)-stable representation. This is equivalent to saying

$$\langle \alpha, \beta \rangle = 0 \text{ and } \langle \alpha, \beta' \rangle \leq 0 \text{ for all } \beta' \hookrightarrow \beta$$

And respectively, β is $\langle \alpha, - \rangle$ -stable if the second inequality is strict for $\beta' \neq 0, \beta$.

The cone of effective weights

The cone of effective weights for a dimension vector β :

$$\mathcal{D}(\beta) = \{\alpha \in \mathbb{Q}^{\mathbb{Q}_0} \mid \langle \alpha, \beta \rangle = 0, \langle \alpha, \beta' \rangle \leq 0, \beta' \hookrightarrow \beta\}$$

The cone of effective weights

The cone of effective weights for a dimension vector β :

$$\mathcal{D}(\beta) = \{\alpha \in \mathbb{Q}^{\mathbb{Q}_0} \mid \langle \alpha, \beta \rangle = 0, \langle \alpha, \beta' \rangle \leq 0, \beta' \hookrightarrow \beta\}$$

Theorem (Schofield)

β is a Schur root if and only if

$\mathcal{D}(\beta)^\circ = \{\alpha \in \mathbb{Q}^{\mathbb{Q}_0} \mid \langle \alpha, \beta \rangle = 0, \langle \alpha, \beta' \rangle < 0 \forall \beta' \hookrightarrow \beta, \beta \neq 0, \beta\}$ is non-empty if and only if β is $\langle \beta, - \rangle - \langle -, \beta \rangle$ -stable.

Big Question

Two rational vectors $\alpha_1, \alpha_2 \in \mathbb{Q}^{Q_0}$, are said to be **GIT-equivalent** (or **ss-equivalent**) if:

$$\text{rep}(Q)_{\langle \alpha_1, - \rangle}^{\text{ss}} = \text{rep}(Q)_{\langle \alpha_2, - \rangle}^{\text{ss}}$$

Big Question

Two rational vectors $\alpha_1, \alpha_2 \in \mathbb{Q}^{Q_0}$, are said to be **GIT-equivalent** (or **ss-equivalent**) if:

$$\text{rep}(Q)_{\langle \alpha_1, - \rangle}^{\text{ss}} = \text{rep}(Q)_{\langle \alpha_2, - \rangle}^{\text{ss}}$$

Main Question: Find necessary and sufficient conditions for α_1 and α_2 to be GIT-equivalent.

Big Question

Two rational vectors $\alpha_1, \alpha_2 \in \mathbb{Q}^{Q_0}$, are said to be **GIT-equivalent** (or **ss-equivalent**) if:

$$\text{rep}(Q)_{\langle \alpha_1, - \rangle}^{\text{ss}} = \text{rep}(Q)_{\langle \alpha_2, - \rangle}^{\text{ss}}$$

Main Question: Find necessary and sufficient conditions for α_1 and α_2 to be GIT-equivalent.

Colin Ingalls, Charles Paquette, and Hugh Thomas gave a characterization in the case that Q is tame, which was published in 2015. Their work was motivated by studying what subcategories of $\text{rep}(Q)$ arise as semi-stable-subcategories, with an eye towards forming a lattice of subcategories.

A tiny bit of AR Theory for tame path algebras

We can build the Auslander-Reiten quiver, Γ , of the path algebra KQ .

A tiny bit of AR Theory for tame path algebras

We can build the Auslander-Reiten quiver, Γ , of the path algebra KQ .

- ▶ Each indecomposable KQ -module corresponds to a vertex in Γ

A tiny bit of AR Theory for tame path algebras

We can build the Auslander-Reiten quiver, Γ , of the path algebra KQ .

- ▶ Each indecomposable KQ -module corresponds to a vertex in Γ
- ▶ All projective indecomposables lie in the same connected component, and *all* indecomposables in that component (called preprojectives) are exceptional (i.e., their dimension vectors are real Schur roots)

A tiny bit of AR Theory for tame path algebras

We can build the Auslander-Reiten quiver, Γ , of the path algebra KQ .

- ▶ Each indecomposable KQ -module corresponds to a vertex in Γ
- ▶ All projective indecomposables lie in the same connected component, and *all* indecomposables in that component (called preprojectives) are exceptional (i.e., their dimension vectors are real Schur roots)
- ▶ Similarly for injectives/preinjectives

A tiny bit of AR Theory for tame path algebras

We can build the Auslander-Reiten quiver, Γ , of the path algebra KQ .

- ▶ Each indecomposable KQ -module corresponds to a vertex in Γ
- ▶ All projective indecomposables lie in the same connected component, and *all* indecomposables in that component (called preprojectives) are exceptional (i.e., their dimension vectors are real Schur roots)
- ▶ Similarly for injectives/preinjectives
- ▶ Remaining indecomposables occur in tubes

A tiny bit of AR Theory for tame path algebras

We can build the Auslander-Reiten quiver, Γ , of the path algebra KQ .

- ▶ Each indecomposable KQ -module corresponds to a vertex in Γ
- ▶ All projective indecomposables lie in the same connected component, and *all* indecomposables in that component (called preprojectives) are exceptional (i.e., their dimension vectors are real Schur roots)
- ▶ Similarly for injectives/preinjectives
- ▶ Remaining indecomposables occur in tubes
 - ▶ Homogeneous tubes (infinitely many)

A tiny bit of AR Theory for tame path algebras

We can build the Auslander-Reiten quiver, Γ , of the path algebra KQ .

- ▶ Each indecomposable KQ -module corresponds to a vertex in Γ
- ▶ All projective indecomposables lie in the same connected component, and *all* indecomposables in that component (called preprojectives) are exceptional (i.e., their dimension vectors are real Schur roots)
- ▶ Similarly for injectives/preinjectives
- ▶ Remaining indecomposables occur in tubes
 - ▶ Homogeneous tubes (infinitely many)
 - ▶ Finitely many non-homogeneous tubes

Non-Homogeneous tubes

Now for example, a rank 3 tube looks like:

↑ *Not Schur*

δ -dimensional, *Schur*

↓ *Schur*

Previous work on the tame case

IPT did the following:

- ▶ Label the non-homogeneous regular tubes in the A-R quiver $1, \dots, N$, and let the period of the i^{th} tube be r_i .

Previous work on the tame case

IPT did the following:

- ▶ Label the non-homogeneous regular tubes in the A-R quiver $1, \dots, N$, and let the period of the i^{th} tube be r_i .
- ▶ Let $\beta_{i,j}$ be the j^{th} quasi-simple root from the i^{th} tube, where $1 \leq j \leq r_i$.

Previous work on the tame case

IPT did the following:

- ▶ Label the non-homogeneous regular tubes in the A-R quiver $1, \dots, N$, and let the period of the i^{th} tube be r_i .
- ▶ Let $\beta_{i,j}$ be the j^{th} quasi-simple root from the i^{th} tube, where $1 \leq j \leq r_i$.
- ▶ Set I to be the multi-index (a_1, \dots, a_N) , where $1 \leq a_i \leq r_i$, and R to be the set of all permissible such multi-indices.

Previous work on the tame case

IPT did the following:

- ▶ Label the non-homogeneous regular tubes in the A-R quiver $1, \dots, N$, and let the period of the i^{th} tube be r_i .
- ▶ Let $\beta_{i,j}$ be the j^{th} quasi-simple root from the i^{th} tube, where $1 \leq j \leq r_i$.
- ▶ Set I to be the multi-index (a_1, \dots, a_N) , where $1 \leq a_i \leq r_i$, and R to be the set of all permissible such multi-indices.
- ▶ Define the cone C_I to be the rational convex polyhedral cone generated by δ , together with $\beta_{i,j}$, **except for** β_{ia_i} .

Previous work on the tame case

Define $\mathcal{J} = \{C_I\}_{I \in R} \cup \{\mathcal{D}(\beta)\}_\beta$, where β is a real Schur root. Set $\mathcal{J}_\alpha = \{C \in \mathcal{J} \mid \alpha \in C\}$.

Previous work on the tame case

Define $\mathcal{J} = \{C_I\}_{I \in R} \cup \{\mathcal{D}(\beta)\}_\beta$, where β is a real Schur root. Set $\mathcal{J}_\alpha = \{C \in \mathcal{J} \mid \alpha \in C\}$.

Theorem (Ingalls, Paquette, Thomas)

For $\alpha_1, \alpha_2 \in \mathbb{Z}^{Q_0}$, we have that α_1 and α_2 are GIT equivalent if and only if $\mathcal{J}_{\alpha_1} = \mathcal{J}_{\alpha_2}$.

The GIT-cone

Let Q be any acyclic quiver.

The GIT-cone

Let Q be any acyclic quiver.

The semi-stable locus of α with respect to β is:

$$\text{rep}(Q, \beta)_{\langle \alpha, - \rangle}^{\text{ss}}$$

The GIT-cone

Let Q be any acyclic quiver.

The semi-stable locus of α with respect to β is:

$$\text{rep}(Q, \beta)_{\langle \alpha, - \rangle}^{\text{ss}}$$

The GIT-cone of α with respect to β :

$$\mathcal{C}(\beta)_\alpha = \{ \alpha' \in \mathcal{D}(\beta) \mid \text{rep}(Q, \beta)_{\langle \alpha, - \rangle}^{\text{ss}} \subseteq \text{rep}(Q, \beta)_{\langle \alpha', - \rangle}^{\text{ss}} \}$$

The GIT-cone

Let Q be any acyclic quiver.

The semi-stable locus of α with respect to β is:

$$\text{rep}(Q, \beta)_{\langle \alpha, - \rangle}^{\text{ss}}$$

The GIT-cone of α with respect to β :

$$\mathcal{C}(\beta)_{\alpha} = \{ \alpha' \in \mathcal{D}(\beta) \mid \text{rep}(Q, \beta)_{\langle \alpha, - \rangle}^{\text{ss}} \subseteq \text{rep}(Q, \beta)_{\langle \alpha', - \rangle}^{\text{ss}} \}$$

This consists of all effective weights “weaker” than α .

The GIT-cone

Let Q be any acyclic quiver.

The semi-stable locus of α with respect to β is:

$$\text{rep}(Q, \beta)_{\langle \alpha, - \rangle}^{\text{ss}}$$

The GIT-cone of α with respect to β :

$$\mathcal{C}(\beta)_{\alpha} = \{\alpha' \in \mathcal{D}(\beta) \mid \text{rep}(Q, \beta)_{\langle \alpha, - \rangle}^{\text{ss}} \subseteq \text{rep}(Q, \beta)_{\langle \alpha', - \rangle}^{\text{ss}}\}$$

This consists of all effective weights “weaker” than α .

The GIT-fan associated to (Q, β) is:

$$\mathcal{F}(\beta) = \{\mathcal{C}(\beta)_{\alpha} \mid \alpha \in \mathcal{D}(\beta)\} \cup \{0\}$$

A few remarks about fans

A **fan** is finite a collection of (rational convex polyhedral) cones satisfying some additional properties. It is said to be pure of dimension n if all cones that are maximal with respect to inclusion are of dimension n .

A few remarks about fans

A **fan** is finite a collection of (rational convex polyhedral) cones satisfying some additional properties. It is said to be pure of dimension n if all cones that are maximal with respect to inclusion are of dimension n .

Theorem

$\mathcal{F}(\beta)$ is a finite fan cover of $\mathcal{D}(\beta)$, and if β is a Schur root, then $\mathcal{F}(\beta)$ is a pure fan of dimension $|\mathcal{Q}_0| - 1$.

A few remarks about fans

A **fan** is finite a collection of (rational convex polyhedral) cones satisfying some additional properties. It is said to be pure of dimension n if all cones that are maximal with respect to inclusion are of dimension n .

Theorem

$\mathcal{F}(\beta)$ is a finite fan cover of $\mathcal{D}(\beta)$, and if β is a Schur root, then $\mathcal{F}(\beta)$ is a pure fan of dimension $|\mathcal{Q}_0| - 1$.

A very useful property of pure fans for our result is the following:

A few remarks about fans

A **fan** is finite a collection of (rational convex polyhedral) cones satisfying some additional properties. It is said to be pure of dimension n if all cones that are maximal with respect to inclusion are of dimension n .

Theorem

$\mathcal{F}(\beta)$ is a finite fan cover of $\mathcal{D}(\beta)$, and if β is a Schur root, then $\mathcal{F}(\beta)$ is a pure fan of dimension $|\mathbb{Q}_0| - 1$.

A very useful property of pure fans for our result is the following:

(Keicher, 2012) Let $\Sigma \subseteq \mathbb{Q}^n$ be a pure n -dimensional fan with convex support $|\Sigma|$, and let $\tau \in \Sigma$ be such that $\tau \cap |\Sigma|^\circ \neq \emptyset$. Then τ is the intersection over all $\sigma \in \Sigma^{(m)}$ satisfying $\tau \leq \sigma$.

Main Theorem

Set

$$\mathcal{I} = \{C(\beta)_\alpha \mid \beta \text{ is a Schur root and } C(\beta)_\alpha \text{ is maximal}\}$$

$$\mathcal{I}_\alpha = \{C \in \mathcal{I} \mid \alpha \in C\}$$

Main Theorem

Set

$$\mathcal{I} = \{C(\beta)_\alpha \mid \beta \text{ is a Schur root and } C(\beta)_\alpha \text{ is maximal}\}$$

$$\mathcal{I}_\alpha = \{C \in \mathcal{I} \mid \alpha \in C\}$$

Theorem (Theorem 1)

Let Q be a connected, acyclic quiver. For $\alpha_1, \alpha_2 \in \mathbb{Q}^{Q_0}$, $\alpha_1 \sim_{GIT} \alpha_2$ if and only if $\mathcal{I}_{\alpha_1} = \mathcal{I}_{\alpha_2}$

Main Theorem

Set

$$\mathcal{I} = \{C(\beta)_\alpha \mid \beta \text{ is a Schur root and } C(\beta)_\alpha \text{ is maximal}\}$$

$$\mathcal{I}_\alpha = \{C \in \mathcal{I} \mid \alpha \in C\}$$

Theorem (Theorem 1)

Let Q be a connected, acyclic quiver. For $\alpha_1, \alpha_2 \in \mathbb{Q}^{Q_0}$, $\alpha_1 \sim_{GIT} \alpha_2$ if and only if $\mathcal{I}_{\alpha_1} = \mathcal{I}_{\alpha_2}$

That is, we have a collection of cones parametrized by Schur roots which characterizes GIT-equivalence classes.

Idea of Proof

Assume $\mathcal{I}_{\alpha_1} = \mathcal{I}_{\alpha_2}$

Idea of Proof

Assume $\mathcal{I}_{\alpha_1} = \mathcal{I}_{\alpha_2}$

If β is $\langle \alpha_1, - \rangle$ -stable, then $\alpha_1 \in \mathcal{D}(\beta)^\circ$, and of course $\alpha_1 \in \mathcal{C}(\beta)_{\alpha_1}$.

Idea of Proof

Assume $\mathcal{I}_{\alpha_1} = \mathcal{I}_{\alpha_2}$

If β is $\langle \alpha_1, - \rangle$ -stable, then $\alpha_1 \in \mathcal{D}(\beta)^\circ$, and of course $\alpha_1 \in \mathcal{C}(\beta)_{\alpha_1}$.

We can apply Keicher's result to conclude that $\mathcal{C}(\beta)_{\alpha_1}$ is an intersection of all maximal cones of which it is a face.

Idea of Proof

Assume $\mathcal{I}_{\alpha_1} = \mathcal{I}_{\alpha_2}$

If β is $\langle \alpha_1, - \rangle$ -stable, then $\alpha_1 \in \mathcal{D}(\beta)^\circ$, and of course $\alpha_1 \in \mathcal{C}(\beta)_{\alpha_1}$.

We can apply Keicher's result to conclude that $\mathcal{C}(\beta)_{\alpha_1}$ is an intersection of all maximal cones of which it is a face.

By the assumption, any such maximal cone contains α_2 as well.

So, $\alpha_2 \in \mathcal{C}(\beta)_{\alpha_1}$. Similarly, $\alpha_1 \in \mathcal{C}(\beta)_{\alpha_2}$.

Idea of Proof

Assume $\mathcal{I}_{\alpha_1} = \mathcal{I}_{\alpha_2}$

If β is $\langle \alpha_1, - \rangle$ -stable, then $\alpha_1 \in \mathcal{D}(\beta)^\circ$, and of course $\alpha_1 \in \mathcal{C}(\beta)_{\alpha_1}$.

We can apply Keicher's result to conclude that $\mathcal{C}(\beta)_{\alpha_1}$ is an intersection of all maximal cones of which it is a face.

By the assumption, any such maximal cone contains α_2 as well.

So, $\alpha_2 \in \mathcal{C}(\beta)_{\alpha_1}$. Similarly, $\alpha_1 \in \mathcal{C}(\beta)_{\alpha_2}$.

Now, if β is arbitrary, use a JH-filtration to break it into a sum of $\langle \alpha_1, - \rangle$ -stable factors.

The tame case

If Q is tame, the collection of cones \mathcal{I} is exactly the collection \mathcal{J} defined by IPT.

The tame case

If Q is tame, the collection of cones \mathcal{I} is exactly the collection \mathcal{J} defined by IPT.

Precisely, C_I is a maximal GIT-cone, namely $\mathcal{C}(\delta)_{\alpha_I}$ where

$$\alpha_I = \delta + \sum_{j \neq a_i} \sum_{i=1}^N \beta_{ij}$$

The tame case

If Q is tame, the collection of cones \mathcal{I} is exactly the collection \mathcal{J} defined by IPT.

Precisely, C_I is a maximal GIT-cone, namely $\mathcal{C}(\delta)_{\alpha_I}$ where

$$\alpha_I = \delta + \sum_{j \neq a_i} \sum_{i=1}^N \beta_{ij}$$

Main ingredients in proof:

- ▶ Realize C_I as the orbit cone of a representation: $\Omega(Z_I)$, where Z_I is a direct sum of Z_i , where Z_i is the unique δ dimensional representation with regular socle of dimension β_{ia_i} .

The tame case

If Q is tame, the collection of cones \mathcal{I} is exactly the collection \mathcal{J} defined by IPT.

Precisely, C_I is a maximal GIT-cone, namely $\mathcal{C}(\delta)_{\alpha_I}$ where

$$\alpha_I = \delta + \sum_{j \neq a_i} \sum_{i=1}^N \beta_{ij}$$

Main ingredients in proof:

- ▶ Realize C_I as the orbit cone of a representation: $\Omega(Z_I)$, where Z_I is a direct sum of Z_i , where Z_i is the unique δ dimensional representation with regular socle of dimension β_{ia_i} .
- ▶ Show that the Z_i 's and the homogeneous δ -dimensional representations are the *only* δ -dimensional representations which are polystable with respect to the weight

$$\alpha_I = \delta + \sum_{j \neq a_i} \sum_{i=1}^N \beta_{ij}$$

The tame case

If Q is tame, the collection of cones \mathcal{I} is exactly the collection \mathcal{J} defined by IPT.

Precisely, C_I is a maximal GIT-cone, namely $\mathcal{C}(\delta)_{\alpha_I}$ where

$$\alpha_I = \delta + \sum_{j \neq a_i} \sum_{i=1}^N \beta_{ij}$$

Main ingredients in proof:

- ▶ Realize C_I as the orbit cone of a representation: $\Omega(Z_I)$, where Z_I is a direct sum of Z_i , where Z_i is the unique δ dimensional representation with regular socle of dimension β_{ia_i} .
- ▶ Show that the Z_i 's and the homogeneous δ -dimensional representations are the *only* δ -dimensional representations which are polystable with respect to the weight $\alpha_I = \delta + \sum_{j \neq a_i} \sum_{i=1}^N \beta_{ij}$
- ▶ Invoke a result that $\mathcal{C}(\beta)_{\alpha} = \bigcap \Omega(W)$ (Chindris, "On GIT Fans for Quivers")

Example

Let $Q = \tilde{A}_1$:

Example

Let $Q = \tilde{A}_1$:

Real Roots: $(n, n+1)$ and $(n+1, n)$ for $n \geq 0$

Example

Let $Q = \tilde{A}_1$:

Real Roots: $(n, n+1)$ and $(n+1, n)$ for $n \geq 0$

Isotropic Roots: (n, n) for $n \geq 1$.

Example

Let $Q = \tilde{A}_1$:

Real Roots: $(n, n+1)$ and $(n+1, n)$ for $n \geq 0$

Isotropic Roots: (n, n) for $n \geq 1$.

In particular, $\delta = (1, 1)$ is the unique isotropic Schur root.

Example

Let $Q = \tilde{A}_1$:

Real Roots: $(n, n+1)$ and $(n+1, n)$ for $n \geq 0$

Isotropic Roots: (n, n) for $n \geq 1$.

In particular, $\delta = (1, 1)$ is the unique isotropic Schur root.

$\mathcal{D}((0, 1))$ is generated by $(1, 2)$ and $(-1, -2)$

Example

Let $Q = \tilde{A}_1$:

Real Roots: $(n, n+1)$ and $(n+1, n)$ for $n \geq 0$

Isotropic Roots: (n, n) for $n \geq 1$.

In particular, $\delta = (1, 1)$ is the unique isotropic Schur root.

$\mathcal{D}((0, 1))$ is generated by $(1, 2)$ and $(-1, -2)$

$\mathcal{D}((1, 0))$ is generated by $(0, 1)$ and $(0, -1)$

Example

Let $Q = \tilde{A}_1$:

Real Roots: $(n, n+1)$ and $(n+1, n)$ for $n \geq 0$

Isotropic Roots: (n, n) for $n \geq 1$.

In particular, $\delta = (1, 1)$ is the unique isotropic Schur root.

$\mathcal{D}((0, 1))$ is generated by $(1, 2)$ and $(-1, -2)$

$\mathcal{D}((1, 0))$ is generated by $(0, 1)$ and $(0, -1)$

For $n \geq 1$, $\mathcal{D}((n, n+1))$ is generated by $(n+1, n+2)$, and

$\mathcal{D}((n+1, n))$ is generated by $(n, n-1)$.

Example

Let $Q = \tilde{A}_1$:

Real Roots: $(n, n+1)$ and $(n+1, n)$ for $n \geq 0$

Isotropic Roots: (n, n) for $n \geq 1$.

In particular, $\delta = (1, 1)$ is the unique isotropic Schur root.

$\mathcal{D}((0, 1))$ is generated by $(1, 2)$ and $(-1, -2)$

$\mathcal{D}((1, 0))$ is generated by $(0, 1)$ and $(0, -1)$

For $n \geq 1$, $\mathcal{D}((n, n+1))$ is generated by $(n+1, n+2)$, and

$\mathcal{D}((n+1, n))$ is generated by $(n, n-1)$.

Lastly, $\mathcal{D}(\delta)$ is generated by δ .

Example

Example

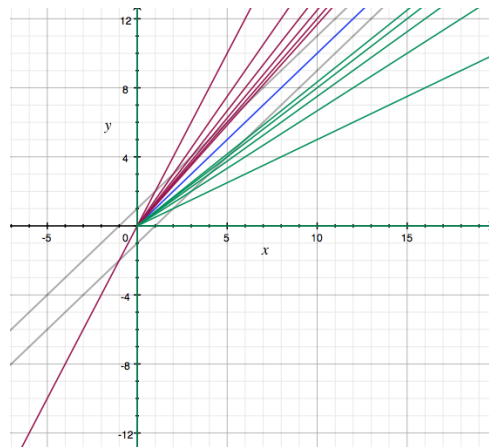

Rays extending
through lattice
points of $y = x + 1$
and $y = x - 1$

Example

Two weights α_1 and α_2 are GIT equivalent if and only if they are on the same collection of rays.

Example

In this case, since the intersection of any two rays is $(0,0)$, we have that α_1, α_2 are GIT-equivalent if they are

- ▶ both $= (0,0)$
- ▶ both in the same ray, i.e., $\alpha_1 = \lambda \alpha_2$ for some $\lambda \in \mathbb{Q}$

Further Questions

- ▶ How can we get our hands on these maximal GIT-cones of Schur roots for wild quivers?
- ▶ Would a similar result hold, using similar techniques, for quivers with relations?

Example

Let $Q = \tilde{\mathbb{A}}_2$:

Example

Let $Q = \tilde{A}_2$:

We want to give an idea of the cones in \mathcal{I} . Recall that

$$\mathcal{I} = \{\mathcal{C}(\delta)_{\alpha_I}\}_{I \in R} \cup \{\mathcal{D}(\beta)\}_{\beta}$$

where the union is over all real Schur roots β .

Example

Starting with the dimension vectors of the projective and injective indecomposables, and applying the A-R translate, we get infinitely many real Schur roots:

Example

Starting with the dimension vectors of the projective and injective indecomposables, and applying the A-R translate, we get infinitely many real Schur roots:

$$\begin{array}{cccccccc} \underline{\dim} P_0 = (1, 0, 1) & \xrightarrow{\tau^-} & (2, 2, 3) & \xrightarrow{\tau^-} & (4, 3, 4) & \xrightarrow{\tau^-} & (5, 5, 6) & \xrightarrow{\tau^-} \dots \\ \underline{\dim} P_1 = (1, 1, 2) & \xrightarrow{\tau^-} & (3, 2, 3) & \xrightarrow{\tau^-} & (4, 4, 5) & \xrightarrow{\tau^-} & (6, 5, 6) & \xrightarrow{\tau^-} \dots \\ \underline{\dim} P_2 = (0, 0, 1) & \xrightarrow{\tau^-} & (2, 1, 2) & \xrightarrow{\tau^-} & (3, 3, 4) & \xrightarrow{\tau^-} & (5, 4, 5) & \xrightarrow{\tau^-} \dots \\ \underline{\dim} I_0 = (1, 1, 0) & \xrightarrow{\tau} & (2, 3, 2) & \xrightarrow{\tau} & (4, 4, 3) & \xrightarrow{\tau} & (5, 6, 5) & \xrightarrow{\tau} \dots \\ \underline{\dim} I_1 = (0, 1, 0) & \xrightarrow{\tau} & (2, 2, 1) & \xrightarrow{\tau} & (3, 4, 3) & \xrightarrow{\tau} & (5, 5, 4) & \xrightarrow{\tau} \dots \\ \underline{\dim} I_2 = (1, 2, 1) & \xrightarrow{\tau} & (3, 3, 2) & \xrightarrow{\tau} & (4, 5, 4) & \xrightarrow{\tau} & (6, 6, 5) & \xrightarrow{\tau} \dots \end{array}$$

Example

Starting with the dimension vectors of the projective and injective indecomposables, and applying the A-R translate, we get infinitely many real Schur roots:

$$\begin{array}{cccccccc} \underline{\dim} P_0 = (1, 0, 1) & \xrightarrow{\tau^-} & (2, 2, 3) & \xrightarrow{\tau^-} & (4, 3, 4) & \xrightarrow{\tau^-} & (5, 5, 6) & \xrightarrow{\tau^-} \dots \\ \underline{\dim} P_1 = (1, 1, 2) & \xrightarrow{\tau^-} & (3, 2, 3) & \xrightarrow{\tau^-} & (4, 4, 5) & \xrightarrow{\tau^-} & (6, 5, 6) & \xrightarrow{\tau^-} \dots \\ \underline{\dim} P_2 = (0, 0, 1) & \xrightarrow{\tau^-} & (2, 1, 2) & \xrightarrow{\tau^-} & (3, 3, 4) & \xrightarrow{\tau^-} & (5, 4, 5) & \xrightarrow{\tau^-} \dots \\ \underline{\dim} I_0 = (1, 1, 0) & \xrightarrow{\tau} & (2, 3, 2) & \xrightarrow{\tau} & (4, 4, 3) & \xrightarrow{\tau} & (5, 6, 5) & \xrightarrow{\tau} \dots \\ \underline{\dim} I_1 = (0, 1, 0) & \xrightarrow{\tau} & (2, 2, 1) & \xrightarrow{\tau} & (3, 4, 3) & \xrightarrow{\tau} & (5, 5, 4) & \xrightarrow{\tau} \dots \\ \underline{\dim} I_2 = (1, 2, 1) & \xrightarrow{\tau} & (3, 3, 2) & \xrightarrow{\tau} & (4, 5, 4) & \xrightarrow{\tau} & (6, 6, 5) & \xrightarrow{\tau} \dots \end{array}$$

Each one of these real Schur roots will correspond to a $\mathcal{D}(\beta) \in \mathcal{I}$.

Example

For example, if we take $\beta = (0, 0, 1)$, we have $\mathcal{D}(\beta)$ is generated by $-\underline{\dim}P_0 = (-1, 0, -1)$, $-\underline{\dim}P_1 = (-1, -1, -2)$ and $(1, 0, 1)$, which is $-\langle -, \beta \rangle$ -stable.

Example

For example, if we take $\beta = (0, 0, 1)$, we have $\mathcal{D}(\beta)$ is generated by $-\underline{\dim}P_0 = (-1, 0, -1)$, $-\underline{\dim}P_1 = (-1, -1, -2)$ and $(1, 0, 1)$, which is $-\langle -, \beta \rangle$ -stable.

Thus, $\mathcal{D}(\beta)$ looks like:

Example

If we take $\beta = (1, 1, 2)$, which is sincere, we have $\mathcal{D}(\beta)$ is generated by $(0, 1, 1)$ and $(2, 1, 2)$ which are both $-\langle -, \beta \rangle$ -stable.

Example

If we take $\beta = (1, 1, 2)$, which is sincere, we have $\mathcal{D}(\beta)$ is generated by $(0, 1, 1)$ and $(2, 1, 2)$ which are both $-\langle -, \beta \rangle$ -stable.

Thus, $\mathcal{D}(\beta)$ looks like:

Example

Now, turning to the regular representations, we have $\delta = (1, 1, 1)$.

Example

Now, turning to the regular representations, we have $\delta = (1, 1, 1)$.
If $\beta = (x, y, z)$ is quasi-simple, it must satisfy:

$$\left\{ \begin{array}{l} \langle \delta, \beta \rangle = y - z = 0 \end{array} \right.$$

Example

Now, turning to the regular representations, we have $\delta = (1, 1, 1)$.
If $\beta = (x, y, z)$ is quasi-simple, it must satisfy:

$$\left\{ \begin{array}{l} \langle \delta, \beta \rangle = y - z = 0 \\ \langle \beta, \beta \rangle = x^2 + y^2 + z^2 - xy - xz - yz = 1 \end{array} \right.$$

Example

Now, turning to the regular representations, we have $\delta = (1, 1, 1)$.
If $\beta = (x, y, z)$ is quasi-simple, it must satisfy:

$$\begin{cases} \langle \delta, \beta \rangle = y - z = 0 \\ \langle \beta, \beta \rangle = x^2 + y^2 - 2xy = 1 \end{cases}$$

Example

Now, turning to the regular representations, we have $\delta = (1, 1, 1)$.
If $\beta = (x, y, z)$ is quasi-simple, it must satisfy:

$$\begin{cases} \langle \delta, \beta \rangle = y - z = 0 \\ \langle \beta, \beta \rangle = x^2 + y^2 - 2xy = 1 \\ \beta \leq \delta, \text{ i.e., } x \leq 1, y \leq 1, z \leq 1 \end{cases}$$

Example

Now, turning to the regular representations, we have $\delta = (1, 1, 1)$.
If $\beta = (x, y, z)$ is quasi-simple, it must satisfy:

$$\begin{cases} \langle \delta, \beta \rangle = y - z = 0 \\ \langle \beta, \beta \rangle = x^2 + y^2 - 2xy = 1 \\ \beta \leq \delta, \text{ i.e., } x \leq 1, y \leq 1, z \leq 1 \end{cases}$$

So, the only quasi-simples are $(0, 1, 1)$ and $(1, 0, 0)$. That is, we have a single non-homogeneous tube in the regular component of the A-R quiver, and it has period 2.

Example

Now, turning to the regular representations, we have $\delta = (1, 1, 1)$. If $\beta = (x, y, z)$ is quasi-simple, it must satisfy:

$$\begin{cases} \langle \delta, \beta \rangle = y - z = 0 \\ \langle \beta, \beta \rangle = x^2 + y^2 - 2xy = 1 \\ \beta \leq \delta, \text{ i.e., } x \leq 1, y \leq 1, z \leq 1 \end{cases}$$

So, the only quasi-simples are $(0, 1, 1)$ and $(1, 0, 0)$. That is, we have a single non-homogeneous tube in the regular component of the A-R quiver, and it has period 2.

Now, $\beta_{11} = (0, 1, 1)$ and $\beta_{12} = (1, 0, 0)$ are themselves real Schur roots, and so $\mathcal{D}(\beta_{11})$ and $\mathcal{D}(\beta_{12})$ are in \mathcal{I} .

Example

Lastly, we need the $C(\delta)_{\alpha_I}$'s.

Example

Lastly, we need the $C(\delta)_{\alpha_I}$'s.

For $I = (1)$, we have

$\alpha_I = \delta + \beta_{12} = (2, 1, 1)$ and

$C(\delta)_{\alpha_I}$ is generated, as a cone,
by $(1, 1, 1)$ and $(1, 0, 0)$.

Example

Lastly, we need the $C(\delta)_{\alpha_I}$'s.

For $I = (1)$, we have

$$\alpha_I = \delta + \beta_{12} = (2, 1, 1) \text{ and}$$

$C(\delta)_{\alpha_I}$ is generated, as a cone,
by $(1, 1, 1)$ and $(1, 0, 0)$.

For $I = (2)$, we have

$$\alpha_I = \delta + \beta_{11} = (1, 2, 2) \text{ and}$$

$C(\delta)_{\alpha_I}$ is generated, as a cone,
by $(1, 1, 1)$ and $(0, 1, 1)$.

Example

Lastly, we need the $C(\delta)_{\alpha_I}$'s.

For $I = (1)$, we have

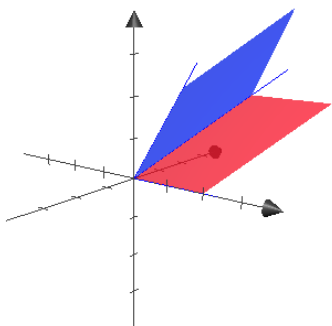

$\alpha_I = \delta + \beta_{12} = (2, 1, 1)$ and

$C(\delta)_{\alpha_I}$ is generated, as a cone,
by $(1, 1, 1)$ and $(1, 0, 0)$.

For $I = (2)$, we have

$\alpha_I = \delta + \beta_{11} = (1, 2, 2)$ and

$C(\delta)_{\alpha_I}$ is generated, as a cone,
by $(1, 1, 1)$ and $(0, 1, 1)$.

[Animation with many of the cones from \mathcal{I}]
