## Homework3 Solution

Problem 1:

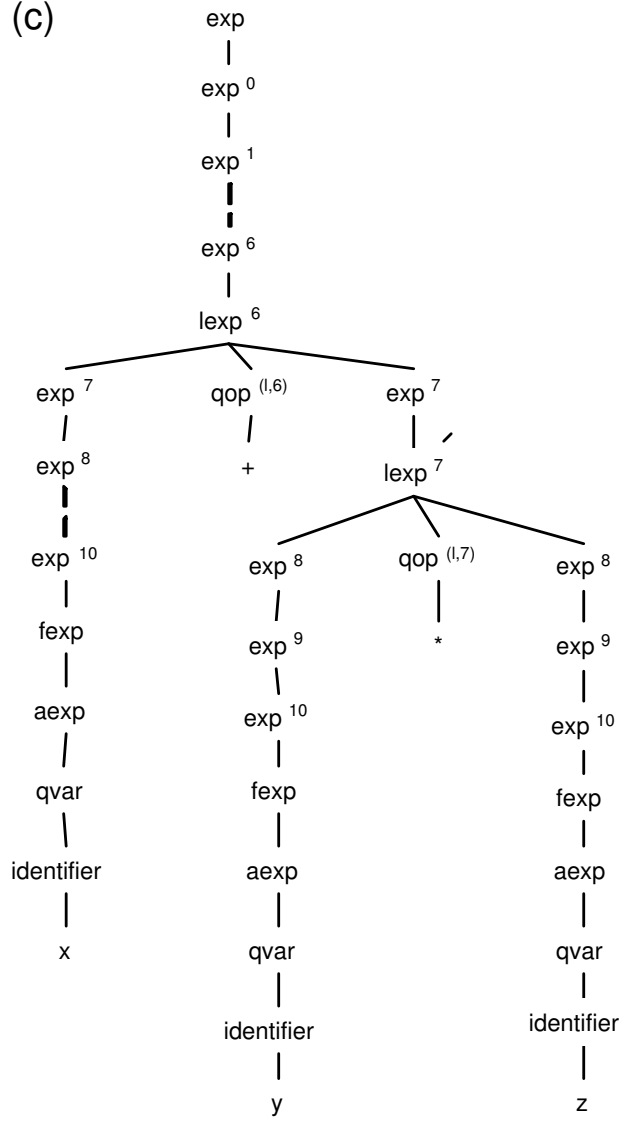

(a)

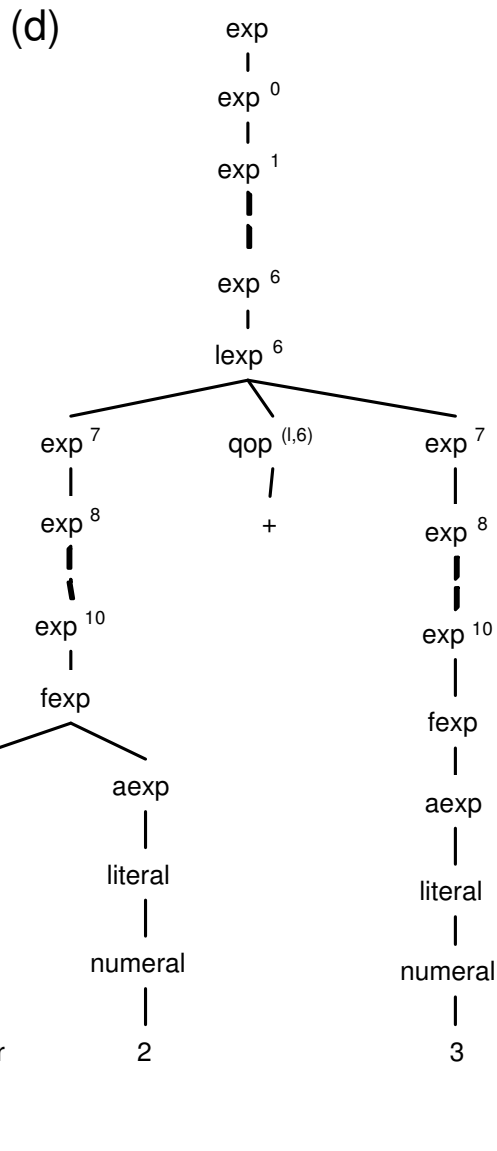

(b)

(c)

**Problem 2:**

(a) `sqrt 4+5`

type: *Floating a*  $\Rightarrow$  *a*

result: 7.0

explain: Since function application has the highest priority, the expression will be evaluated as `(sqrt 4)+5`.

(b) 'a':'b':[]  
 type: [Char]  
 result: "ab"  
 explain: 'a':('b':[]), : right associative. The type [Char]≡ String.

(c) (2\*)3  
 type: Num a => a  
 result: 6  
 explain: 2\*3, \* is an infix operator, (2\*) is partial function application.

(d) [(\*),(+)]  
 type: [Integer -> Integer -> Integer]  
 result: ERROR - Cannot find "show" function for Expression : [(\*),(+)]  
 explain: (\*) and (+) are the representation for the infix operator '\*' and '+'.  
 The expression is a list of type: Integer -> Integer -> Integer functions.

(e) fst ((<),(/)) 3 5  
 type: (Num a, Ord a, Fractional b) => Bool  
 result: True  
 explain: fst is a function with type (a,b)-> a. So fst ((<),(/)) 3 5 evaluates to (fst ((<),(/)) ) 3 5 => (<) 3 5. Since (<) is an infix operator with type of: Ord a => a -> a -> Bool, the value of the expression is 'True' because 3<5.

### Problem 3:

```
pal [] = True      -- empty list is a palindrome

pal (y:[]) = True -- list with one item is a palindrome

pal (x:xs) = x==last xs && pal (init xs) -- check first and last

-- item same, remove them and test rest
```

### Problem 4:

```
isVowel x | elem x "aeiou"    = True
           | otherwise        = False
```
