

Example of calculating the fundamental group of a graph  $G$

Note: This graph includes a loop and some vertices connected by more than one edge; the method of calculating  $\pi_1(G)$  for graphs is not bothered by these.

Step 0: List the vertices:  $v_0, v_1, v_2, v_3, v_4, v_5$

Step 1: List the edges, and give each an orientation:  $a, b, c, d, e, f, g, h, k$ .  
 Note each "edge" is a path in  $G$ . Denote the *reverse* of each edge as  $a^{\wedge}, b^{\wedge}, c^{\wedge}, d^{\wedge}, e^{\wedge}, f^{\wedge}, g^{\wedge}, h^{\wedge}, k^{\wedge}$ .

Step 2: Identify a maximal tree,  $T$ , in  $G$ .

Step 3: Pick one vertex to be the basepoint.  
 (We will use  $v_0$ .)

Step 4: For each edge NOT in the maximal tree, construct a path from  $v_0$  to the beginning of the edge, and another path from the end of the edge back to  $v_0$ .  
 (Note: Because  $T$  is a tree, these paths are unique; except for duplicating a path (forward, back, forward again) there is only one way to travel in  $T$  from  $v_0$  to another vertex.) This gives a set of loops in  $G$  based at  $v_0$ :

In our example, the four edges not in  $T$  are  $d, f, h, k$ .  
 The corresponding loops (based at the basepoint  $v_0$ ) are  
 $b^{\wedge}c^{\wedge}db$   
 $b^{\wedge}efg$   
 $a^{\wedge}ha$   
 $kcb$

The fundamental group  $\pi_1(G)$  is a free group of rank 4, and the loop classes  $[b^{\wedge}c^{\wedge}db], [b^{\wedge}efg], [a^{\wedge}ha], [kcb]$  are a free basis for the group.

[end of handout - when we want to analyze a covering space, it can help to be fussy/careful in this way]
