5.____

Problem 1.

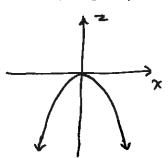

$$Let f(x,y) = y^2 - x^2.$$

For all of the graphs below: label the axes, and label the graphs with their functions.

a. Sketch the section of the graph of f by the plane x = 0, that is z = f(0, y).

b. Sketch the section of the graph of f by the plane y = 0, that is z = f(x, 0).

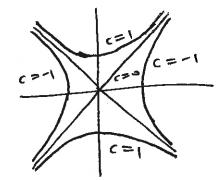

c. Sketch the level curves at height c, that is f(x,y) = c for the values of c = -1,0 and 1.

Hyperbalos
$$\begin{cases} y^{1}-x^{2}=1\\ y^{2}-x^{2}=-1 \end{cases}$$

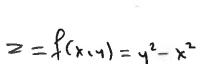

$$y^{1} - x^{2} = 1$$

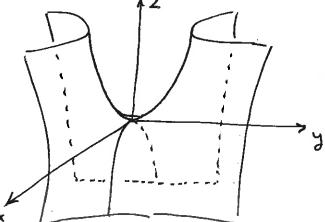

$$y^{2} - x^{2} = -1$$

y2-x1=0 (=>) y=±x

d. Sketch the explicit graph of z = f(x, y). Describe it in words if you can't draw it.

1+ 73 a Saddle

Problem 2.

Let P be the point (4,1,5) and the line ℓ be given by the equations $\begin{cases} x = t \\ y = 1+t \text{ in } \mathbb{R}^3. \\ z = t \end{cases}$

a. Find a parametric equation for the plane that contains the point P and the line ℓ .

| line
$$R(t) = (0,1,0) + t(1,1,1)$$

| place $\Gamma(s,1) = (0,1,0) + t(1,1,1) + s(4,0,5)$
(0,1,0) (1,1) $P-Q = (4,1,5) - (0,1,0)$
 $Q = (4,0,5)$

b. Find the distance between P and the line ℓ .

$$\begin{aligned}
u &= P - Q = (4,0,5) \\
Q &= (4,0,5) &= (4,0,5) \cdot (1,1,1) \\
Q &= (4,0,5) &= (4,0,5) \cdot (1,1,1) \\
Q &= (4,0,5) \cdot (1,1,1) \cdot (1,1,1) \\
&= \frac{9}{3} (1,1,1) \cdot (1,1,1) \\
&= \frac{9}{3} (1,1,1) = (3,3,3) \\
W &= u - proj_{u} = (4,0,5) - (3,3,3) = (1,-3,2) \\
||w|| &= distance between land P \\
&= \sqrt{\frac{1^{2} + (-5)^{2} + 2^{2}}{14}} = \sqrt{\frac{14}{14}}
\end{aligned}$$

Problem 3. Let $f(x,y) = 3xye^{2y} + (\ln x) - y^2 + 2$.

a. Calculate all first and second order partial derivatives of f.

$$f_{x} = 3y \cdot e^{2y} + \frac{1}{x}$$

$$f_{y} = 3x \cdot e^{2y} + (3xy)(2e^{2y}) - 2y$$

$$f_{xx} = -\frac{1}{x^{2}}$$

$$f_{xx} = -\frac{1}{x^2}$$

$$f_{xy} = 3e^{2y} + 3y \cdot 2e^{2y} = 3e^{2y} + 6y e^{2y}$$

$$f_{yx} = 3 \cdot e^{2y} + 3y \cdot 2e^{2y} = 3e^{2y} + 6y e^{2y}$$

b. Calculate the gradient $\nabla f(1,0)$.

c. Find an equation describing the tangent plane to the explicit graph of z = f(x, y) when x = 1and y = 0.

$$z = 2 + 1(x-1) + 3(y-0)$$

equation of the tangent plane

for bxc:

$$f(1,0) = 2$$

 $f_{x}(1,0) = 1$
 $f_{y}(1,0) = 3$

Problem 4.

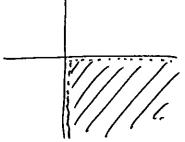

Let $f(x,y,z) = (xy+z, x-2y+z^2)$ and $g(u,v) = (u+v^2, uv, u-v)$. Calculate the following: Df, Dg, and $D(f \circ g)(2,1)$.

$$Df = \begin{bmatrix} y & x & 1 \\ 1 & -2 & 2z \end{bmatrix}$$

$$D(\mathbf{f} \circ \mathbf{g})(2,1) = \int f(g(2,1)) \cdot Dg(2,1)$$

$$= \int f(3,2,1) \cdot Dg(2,1)$$

$$= \left[\begin{array}{cccc} 2 & 3 & 1 \\ 1 & -2 & 2 \end{array} \right] \left[\begin{array}{cccc} 1 & 2 \\ 1 & 2 \\ 1 & -1 \end{array} \right] = \left[\begin{array}{cccc} 6 & 9 \\ 1 & -4 \end{array} \right]$$

Problem 5.

a. Let $A = \{(x,y) | 0 < x \text{ and } 0 > y\}$ be a subset of \mathbb{R}^2 . What is the boundary of A?

Bd
$$A = \{(x,y) | (0 \le x \text{ and } y = 0) \}$$

Is A an open set? Circle the correct answer: (YES) or NO.

 $\beta \downarrow A \land A = \not \Rightarrow$ Is A a closed set? Circle the correct answer: YES or NO

b. Calculate the following limits. If any of them does not exist, state it so. Justify your answers.

i.
$$\lim_{(x,y)\to(0,0)} \frac{x^2y^2}{x^2+y^2} = \bigcirc$$

$$0 \leq \frac{\chi^2}{\chi^2 + 4^2} \leq 1$$

Then use squeeze Thm.

ii.
$$\lim_{(x,y)\to(0,0)} \frac{x^2-y^2}{x^2+y^2} =$$

(f one approaches (0,0) along x-axis (x,0) \rightarrow (0,0)

$$(x,0) \rightarrow (0,0)$$
 $\frac{x^2+0^2}{x^2-0^2} = 1$

$$\frac{X^2-0^2}{x^2+0^2}=1$$

$$^{\mathcal{E}}$$

(f one oppisacher (0,0) along y-axis

$$\lim_{(0,4)\to(0,5)} \frac{0^2 - 4^2}{0 + 4^2} = -1 \quad \textcircled{8} \textcircled{8}$$

(f lim x2-42 were to ex11+) then (x,4)+ (0,0) x2+42

would have been equal, but they aren't. I'm x2
