A User Manual for Oolong

Teodor Rus

December 2, 2007

1. The Oolong was installed in the class directory `/group/class/c113/jvm`. You can use it while logged in your linux directory. For that while you are in your linux directory set the environment using the following commands:

   - for bash: `$ export CLASSPATH=/group/class/c113/jvm:.`
   - for csh: `$ setenv CLASSPATH /group/class/c113/jvm:.`

   where $ is your linux prompt. You can also import it into your account by adding the above line to your `.bashrc` (or `.csrhc`) file.

2. Once this is done, you can call the assembler on the Oolong file test.j by:
   `$ java Oolong test.j`
   which generate the executable "test"

3. To run the class-example test on the arguments a1 a2 one need to type
   `$ java test a1 a2`.
   If the class-name in the file test.j is different from `test` then you need to use the class-name in the above command to run the Oolong program. For example, if the class-name in test.j is `className` then the above command should be:
   `$ java className a1 a2`.

4. The result is printed to the screen.
