

## EXTENSION OF INCOMPRESSIBLE SURFACES ON THE BOUNDARIES OF 3-MANIFOLDS

MICHAEL FREEDMAN<sup>1</sup>, HUGH HOWARDS AND YING-QING WU<sup>2</sup>

An incompressible bounded surface  $F$  on the boundary of a compact, connected, orientable 3-manifold  $M$  is arc-extendible if there is a properly embedded arc  $\gamma$  on  $\partial M - \text{Int}F$  such that  $F \cup N(\gamma)$  is incompressible, where  $N(\gamma)$  is a regular neighborhood of  $\gamma$  in  $\partial M$ . Suppose for simplicity that  $M$  is irreducible and  $F$  has no disk components. If  $M$  is a product  $F \times I$ , or if  $\partial M - F$  is a set of annuli, then clearly  $F$  is not arc-extendible. The main theorem of this paper shows that these are the only obstructions for  $F$  to be arc-extendible.

Suppose  $F$  is a compact incompressible surface on the boundary of a compact, connected, orientable, irreducible 3-manifold  $M$ . Let  $F'$  be a component of  $\partial M - \text{Int}F$  with  $\partial F' \neq \emptyset$ . We say that  $F$  is *arc-extendible* (in  $F'$ ) if there is a properly embedded arc  $\gamma$  in  $F'$  such that  $F \cup N(\gamma)$  is incompressible. In this case  $\gamma$  is called an *extension arc* of  $F$ . We study the problem of which incompressible surfaces on the boundary  $M$  are arc-extendible. The result will be used in [H], in which it is shown that a compact, orientable 3-manifold  $M$  contains arbitrarily many disjoint, non-parallel, non-boundary parallel, incompressible surfaces, if and only if  $M$  has at least one boundary component of genus greater than or equal to two.

Denote by  $I$  the unit interval  $[0, 1]$ . We say that  $M$  is a product  $F \times I$  if there is a homeomorphism  $\varphi : M \cong F \times I$  with  $\varphi(F) = F \times 1$ . Note that in this case  $F' = \partial M - \text{Int}F$ , and  $F$  is not arc-extendible. A surface  $F$  is *diskless* if it has no disk component. An incompressible surface with a disk component is always arc-extendible, unless the disk lies on a sphere component of  $\partial M$ . Thus to avoid trivial cases, we will only consider arc-extension of diskless surfaces.

**Theorem 1.** *Let  $F$  be a diskless, compact, incompressible surface on the boundary of a compact, connected, orientable, irreducible 3-manifold  $M$ , and let  $F'$  be a non-annular component of  $\partial M - \text{Int}F$  with  $\partial F' \neq \emptyset$ . Then either  $F$  is arc-extendible in  $F'$ , or  $M$  is a product  $F \times I$ .*

The proof of the theorem involves some deep results about incompressible surfaces related to Dehn surgery and 2-handle additions. It breaks down into three cases. The case that  $F'$  is a thrice punctured sphere is treated in Theorem 4, which shows that if the surface obtained by gluing  $F$  and  $F'$  along one of the boundary curves of  $F'$  is compressible for all the three boundary curves of  $F'$ , then  $M$  must be a product. The second case is that  $F'$  is parallel into  $F$  (see below for definition). A similar result as above holds in this case. Theorem 9 shows that in the remaining

case there is an arc  $\gamma$  intersecting some circle  $C$  in  $F'$  at one point, so that all but at most three Dehn twists of  $\gamma$  along  $C$  are extension arcs of  $F$ . Moreover, in this case the extension arc  $\gamma$  of  $F$  can be chosen to have endpoints on any prescribed components of  $\partial F'$ . See Theorem 10 below.

Note that the connectedness and irreducibility of  $M$  are irrelevant to the compressibility of surfaces on  $\partial M$ . However, this does make the conclusion of the theorem simpler. If we drop these assumptions from the theorem, the conclusion should be changed to “Either  $F$  is arc-extendible in  $F'$ , or the summand  $M'$  of the component of  $M$  containing  $F'$  is a product  $F' \times I$ , with  $\partial M' - \text{Int} F'$  a component of  $F$ .”

Given a simple closed curve  $\alpha$  on a surface  $S$  on the boundary of  $M$ , we use  $M[\alpha]$  to denote the manifold obtained by adding a 2-handle to  $M$  along the curve  $\alpha$ . More explicitly,  $M[\alpha]$  is the union of  $M$  and a  $D^2 \times I$ , with the annulus  $(\partial D^2) \times I$  glued to a regular neighborhood  $N(\alpha)$  of  $\alpha$  on  $\partial M$ . Use  $S[\alpha]$  to denote the surface on  $\partial M[\alpha]$  corresponding to  $S$ , i.e.  $S[\alpha] = (S - N(\alpha)) \cup (D^2 \times \partial I)$ . The following two lemmas are very useful in dealing with incompressible surfaces. Various versions of Lemma 2 have been proved by Przytycki [Pr], Johannson [Jo], Jaco [Ja], and Scharlemann [Sch]. The lemma as stated is due to Casson and Gordon [CG].

**Lemma 2.** (The Handle Addition Lemma [CG].) *Let  $\alpha$  be a simple closed curve on a surface  $S$  on the boundary of an orientable irreducible 3-manifold  $M$ , such that  $S$  is compressible and  $S - \alpha$  is incompressible. Then  $S[\alpha]$  is incompressible in  $M[\alpha]$ , and  $M[\alpha]$  is irreducible.*

**Lemma 3.** (The Generalized Handle Addition Lemma.) *Let  $S$  be a surface on the boundary of an orientable 3-manifold  $M$ , let  $\gamma$  be a 1-manifold on  $S$ , and let  $\alpha$  be a circle on  $S$  disjoint from  $\gamma$ . Suppose  $S - \gamma$  is compressible and  $S - (\gamma \cup \alpha)$  is incompressible. If  $D$  is a compressing disk of  $S[\alpha]$  in  $M[\alpha]$ , then there is a compressing disk  $D'$  of  $S - \alpha$  in  $M$  such that  $\partial D' \cap \gamma \subset \partial D \cap \gamma$ .*

*Proof.* This is essentially [Wu2, Theorem 1]. The theorem there stated that  $\partial D' \cap \gamma$  has no more points than  $\partial D \cap \gamma$ , but the proof there gives the stronger conclusion that  $\partial D' \cap \gamma \subset \partial D \cap \gamma$ .  $\square$

We first study the case that the surface  $F'$  in Theorem 1 is a thrice punctured sphere. Let  $\alpha_1, \alpha_2, \alpha_3$  be the boundary curves of  $F'$ . Since  $F'$  is a component of  $\partial M - \text{Int} F$ , we have  $\alpha_i \subset \partial F$  for  $i = 1, 2, 3$ . Note that if  $\text{Int} F \cup \text{Int} F' \cup \alpha_i$  is incompressible for some  $i$ , then for any essential arc  $\gamma$  on  $F'$  with  $\partial \gamma \subset \alpha_i$ , the surface  $F \cup N(\gamma)$  is incompressible. Hence the following theorem proves Theorem 1 in the case that  $F'$  is a thrice punctured sphere. However, it should be noticed that a similar statement is false if we drop the assumption that  $F'$  is a sphere with three holes.

**Theorem 4.** *Let  $F$  be a diskless compact incompressible surface on the boundary of a compact, connected, orientable, irreducible 3-manifold  $M$ , and let  $F'$  be a component of  $\partial M - \text{Int} F$  which is a punctured sphere with  $\partial F' = \alpha_1 \cup \alpha_2 \cup \alpha_3$ . If  $\text{Int} F \cup \text{Int} F' \cup \alpha_i$  is compressible for  $i = 1, 2, 3$ , then  $M$  is a product  $F \times I$ .*

*Proof.* We fix some notation. Write  $\widehat{F} = F \cup F'$ . Denote by  $\widehat{F}_i$  the surface obtained by gluing  $\text{Int} F$  and  $\text{Int} F'$  along  $\alpha_i$ , i.e.  $\widehat{F}_i = \text{Int} F \cup \text{Int} F' \cup \alpha_i$ . Similarly, write  $\widehat{F}_{ij} = \text{Int} F \cup \text{Int} F' \cup \alpha_i \cup \alpha_j$ .

First notice that  $F'$  is incompressible. This is because each simple closed curve on  $F'$  is isotopic to one of the  $\alpha_i \subset F$ , and because  $F$  is incompressible and diskless. Since  $\text{Int}F \cap \text{Int}F' = \emptyset$ , the surface  $\text{Int}F \cup \text{Int}F'$  is incompressible.

Let  $M'$  be the component of a maximal compression body of  $\partial M$  in  $M$  which contains  $\widehat{F}$ . Then a surface on the boundary of  $M'$  is compressible in  $M'$  if and only if it is compressible in  $M$ . Notice that if  $M \neq M'$ , then  $M'$  is never a product  $F \times I$ , so if the theorem is true for  $M'$ , it is true for  $M$ . Hence after replacing  $M$  by  $M'$  if necessary, we may assume without loss of generality that  $M$  is a compression body.

We claim that the curves  $\alpha_1, \alpha_2, \alpha_3$  are mutually nonparallel on  $\widehat{F}$ , that is, no component of  $F$  is an annulus with both boundary components on  $F'$ . If two curves  $\alpha_1, \alpha_2$ , say, are parallel on  $\widehat{F}$ , then the surface  $\text{Int}F \cup \text{Int}F' = \widehat{F} - \alpha_1 \cup \alpha_2 \cup \alpha_3$  is incompressible if and only if  $\widehat{F}_1 = \widehat{F} - \alpha_2 \cup \alpha_3$  is incompressible. However, by assumption  $\widehat{F}_1$  is compressible, and we have shown that  $\text{Int}F \cup \text{Int}F'$  is incompressible. Hence the claim follows.

Since  $\widehat{F}_i$  is compressible, and  $\widehat{F}_i - \alpha_i = \text{Int}F \cup \text{Int}F'$  is incompressible, we can apply the Handle Addition Lemma (Lemma 2) to  $\widehat{F}_i$  and  $\alpha_i$  to conclude that after adding a 2-handle along  $\alpha_i$ , the surface  $\widehat{F}_i[\alpha_i]$  is incompressible in  $M[\alpha_i]$ , and  $M[\alpha_i]$  is irreducible.

Consider the surface  $\widehat{F}[\alpha_1]$ . Notice that after adding the 2-handle, the surface  $F'$  becomes an annulus on  $\widehat{F}[\alpha_1]$  with boundary  $\alpha_2 \cup \alpha_3$ , so the two curves  $\alpha_2, \alpha_3$  are parallel on  $\widehat{F}[\alpha_1]$ . Thus,  $\widehat{F}_1[\alpha_1] = \widehat{F}[\alpha_1] - \alpha_2 \cup \alpha_3$  being incompressible in  $M[\alpha_1]$  implies that  $\widehat{F}[\alpha_1] - \alpha_2$  is incompressible in  $M[\alpha_1]$ . With the above notation, this says that  $\widehat{F}_{13}[\alpha_1]$  is incompressible in  $M[\alpha_1]$ .

By assumption  $\widehat{F}_3$  is compressible in  $M$ . Let  $D$  be a compressing disk of  $\widehat{F}_3$  in  $M$ . Then  $\partial D$  is disjoint from  $\alpha_1 \cup \alpha_2$ , because  $\partial D \subset \widehat{F}_3$ . Also,  $\partial D$  is not isotopic to  $\alpha_1$  in  $\widehat{F}_{13}$ , otherwise  $\alpha_1$  would bound a disk in  $M$ , contradicting the assumption that  $F$  is diskless and incompressible. We have shown that  $\widehat{F}_{13}[\alpha_1]$  is incompressible in  $M[\alpha_1]$ , so  $D$  is not a compressing disk of  $\widehat{F}_{13}[\alpha_1]$  in  $M[\alpha_1]$ , and hence  $\partial D$  must bound a disk in  $\widehat{F}_{13}[\alpha_1]$ . This is true if and only if  $\partial D$  is coplanar to  $\alpha_1$  on  $\widehat{F}_{13}$ , that is, either  $\partial D$  is parallel to  $\alpha_1$ , or it bounds a once punctured torus  $T$  in  $\widehat{F}_{13}$  which contains  $\alpha_1$  as a nonseparating curve. The first possibility has been ruled out, so the second must be true. Let  $\widehat{T}$  be the torus  $T \cup D$ . Since we have assumed above that  $M$  is a compression body, either (i)  $\widehat{T}$  is parallel to a boundary component of  $M$ , or (ii)  $\widehat{T}$  bounds a solid torus, or (iii)  $\widehat{T}$  lies in a 3-ball and bounds a cube with a knotted hole. But since  $T$  lies on  $\partial M$ , a pair of generators of  $H_1(T)$  cannot both be null homologous in  $M$ , hence (iii) cannot happen.

If  $\widehat{T}$  is parallel to a boundary component  $T_0$  of  $M$ , then after adding the 2-handle, the surface  $\widehat{T}[\alpha_1]$  becomes a sphere which separates  $T_0$  from  $\widehat{F}[\alpha_1]$ , hence is a reducing sphere of  $M[\alpha_1]$ , which contradicts the irreducibility of  $M[\alpha_1]$ . Similarly, if  $\widehat{T}$  bounds a solid torus  $V$  but  $\alpha_1$  is not a longitude of  $V$ , then after adding the 2-handle the manifold would have a lens space or  $S^2 \times S^1$  summand, which again contradicts the irreducibility of  $M[\alpha_1]$ . (Note that  $M[\alpha_1]$  cannot be a lens space because it has some boundary components.)

We have now shown that there is a compressing disk  $D$  of  $\widehat{F}_3$  in  $M$  which cuts the manifold into two pieces, one of which is a solid torus  $V$  which contains  $\alpha_1$  as a longitude, but is disjoint from  $\alpha_2$ . Let  $D_1$  be a meridian disk of  $V$ . Then  $\partial D_1 \cap \alpha_1$

is a single point, and  $\partial D_1$  is disjoint from  $\alpha_2$  because  $\partial V$  is disjoint from  $\alpha_2$ . Notice that  $\partial D_1$  is not coplanar to  $\alpha_2$ , for if  $\partial D_1$  were parallel to  $\alpha_2$  then  $\alpha_2$  would also intersect  $\alpha_1$ , and if  $\partial D_1$  were to bound a once punctured torus containing  $\alpha_2$  then  $\partial D_1$  would be a separating curve on  $\partial M$ , so it would intersect  $\alpha_1$  in an even number of points, either case leading to a contradiction. Thus, after adding a 2-handle to  $M$  along  $\alpha_2$ , the disk  $D_1$  remains a compressing disk of  $\widehat{F}[\alpha_2]$ . Since the two curves  $\alpha_1$  and  $\alpha_3$  are parallel in  $\widehat{F}[\alpha_2]$ , and since  $D_1$  intersects  $\alpha_1$  in a single point, we can isotope  $D_1$  to another disk  $D_2$  in  $M[\alpha_2]$  so that it intersects each of  $\alpha_1$  and  $\alpha_3$  in a single point. We are looking for such a disk in  $M$ ; however  $D_2$  is not necessarily the one because it may intersect the attached 2-handle.

Recall that the surface  $\widehat{F}_2$  is compressible, but the surface  $\widehat{F}_2 - \alpha_2 = \text{Int}F \cup \text{Int}F'$  is incompressible. Hence we can apply the Generalized Handle Addition Lemma (Lemma 3, with  $S = \widehat{F}$ ,  $\gamma = \alpha_1 \cup \alpha_3$ , and  $\alpha = \alpha_2$ ) to conclude that there is also a compressing disk  $D_3$  of  $\widehat{F}$  in  $M$ , such that  $\partial D_3$  is disjoint from  $\alpha_2$ , and  $\partial D_3 \cap (\alpha_1 \cup \alpha_3)$  is a subset of  $\partial D_2 \cap (\alpha_1 \cup \alpha_3)$ .

The set  $\partial D_3 \cap (\alpha_1 \cup \alpha_3)$  is nonempty, otherwise, since  $\partial D_3$  is also disjoint from  $\alpha_2$ ,  $D_3$  would be a compressing disk of  $\text{Int}F \cup \text{Int}F'$ , contradicting the incompressibility of  $\text{Int}F \cup \text{Int}F'$ . Since  $\alpha_1 \cup \alpha_2 \cup \alpha_3$  is separating on  $\widehat{F}$ , the curve  $\partial D_3$  can not intersect  $\alpha_1 \cup \alpha_2 \cup \alpha_3$  at a single point. It follows that  $\partial D_3 \cap (\alpha_1 \cup \alpha_3) = \partial D_2 \cap (\alpha_1 \cup \alpha_3)$ , that is,  $\partial D_3$  intersects each of  $\alpha_1, \alpha_3$  in a single point. Such a disk is called a *bigon*.

Denote by  $D_{13}$  the bigon  $D_3$  above. Interchanging the roles of  $\alpha_1$  and  $\alpha_2$  in the above argument, we get another compressing disk  $D_{23}$  of  $\widehat{F}$  in  $M$ , which is disjoint from  $\alpha_1$ , and intersects each of  $\alpha_2, \alpha_3$  in a single point. Using the fact that no compressing disk of  $\widehat{F}$  would intersect  $\alpha_1 \cup \alpha_2 \cup \alpha_3$  at a single point, we can modify  $D_{13}$  and  $D_{23}$  by a simple innermost circle outermost arc disk swapping argument, so that  $D_{13}$  and  $D_{23}$  are disjoint, and still have the same number of intersection points with each  $\alpha_i$ . Cutting  $M$  along  $D_{13} \cup D_{23}$ , we get a submanifold  $M'$  of  $M$ , in which the surface  $F'$  becomes a disk  $\widetilde{F}' \subset F'$ , and the surface  $F$  becomes a surface  $\widetilde{F} \subset F$ . It is clear that one boundary component  $C$  of  $\widetilde{F}$  bounds a disk on  $\partial M'$ , namely the union of  $\widetilde{F}'$  and the two copies of  $D_{13} \cup D_{23}$ . Since  $F$  is incompressible, this curve  $C$  bounds a disk in  $F$ , so  $\widetilde{F}$  must be a disk. These disks together form a sphere boundary component of  $M'$ . Since  $M$  is connected and irreducible,  $M'$  must be a 3-ball, so it is a product  $\widetilde{F} \times I$ . Gluing back along  $D_{13}$  and  $D_{23}$ , we see that  $M$  is a product  $F \times I$ . This completes the proof of Theorem 4.  $\square$

Below,  $F, F'$  and  $M$  will be as in Theorem 1. Using Theorem 4 we may assume that  $F'$  is not a thrice punctured sphere. A curve  $C'$  on  $F'$  is  *$\partial$ -nonseparating* if (i)  $C'$  is not parallel to a boundary curve on  $F'$ , and (ii) there is a proper arc  $\gamma$  in  $F'$  intersecting  $C'$  in a single point. A sub-surface  $G'$  of  $F'$  is *parallel into  $F$*  if there is a product  $G' \times I \subset M$  such that  $G' = G' \times 0$ , and  $G' \times 1 \subset F$ . Similarly, a curve  $C'$  on  $F'$  is *parallel into  $F$*  if there is an embedded annulus  $A \subset M$  with  $\partial A = C' \cup C$ , where  $C \subset F$ .

**Lemma 5.** *If  $F'$  is compressible, then there is a  $\partial$ -nonseparating curve  $C'$  on  $F'$  which is not parallel into  $F$ .*

*Proof.* Let  $D$  be a compressing disk of  $F'$ . If  $\partial D$  is non-separating on  $F'$ , let  $C'$  be a curve in  $F'$  that intersects  $\partial D$  in one point. Then  $C'$  is nonseparating, hence  $\partial$ -nonseparating on  $F'$ . We want to show that  $C'$  is not parallel into  $F$ . Otherwise, let  $A$  be an annulus with  $\partial A = C' \cup C$ , where  $C \subset F$ . Then  $A \cap D$  is a proper

1-manifold on  $D$ . But  $\partial(A \cap D) = (\partial A) \cap \partial D$  is a single point, which is absurd. Hence  $C'$  is the curve required.

Now assume that  $\partial D$  is separating on  $F'$ , cutting  $F'$  into  $F'_1$  and  $F'_2$ . Choose a simple loop  $C_i$  on  $F'_i$  as follows. If  $F'_i$  is nonplanar, then it contains a pair of nonseparating curves intersecting each other in one point, at least one of which is not null-homologous in  $M$ . Choose this one as  $C_i$ . If  $F'_i$  is planar, choose  $C_i$  to be isotopic to a boundary curve of  $F'$ . Note that since  $F$  is incompressible and diskless,  $C_i$  is not null-homotopic in  $M$ . Also notice that in all cases there is a properly embedded arc  $\gamma$  on one of the  $F'_i$  which intersects  $C_1 \cup C_2$  in one point.

Now choose a band  $B = I \times I$  on  $F'$  such that  $B \cap \partial D = I \times \frac{1}{2}$ ,  $B \cap C_1 = I \times 0$ ,  $B \cap C_2 = I \times 1$ , and  $B$  is disjoint from the arc  $\gamma$  above. Such a band exists because  $\gamma$  is a nonseparating arc on  $F'_i$ . Let  $C'$  be the band sum of  $C_1$  and  $C_2$ , that is,  $C' = (C_1 \cup C_2 - I \times \{0, 1\}) \cup (\{0, 1\} \times I)$ . Then  $C'$  intersects  $\gamma$  in one point. Since  $C'$  intersects  $\partial D$  essentially in two points, it is not parallel to any boundary component on  $F'$ . Therefore  $C'$  is  $\partial$ -nonseparating.

We want to show that  $C'$  is not parallel into  $F$ . Using the property that  $C_i$  are not null-homotopic in  $M$ , one can show by an innermost circle argument that  $C'$  is not null-homotopic in  $M$ . Now suppose that there is an annulus  $A$  in  $M$  with  $\partial A = C' \cup C$ , where  $C \subset F$ . Since  $C'$  is not null-homotopic in  $M$ ,  $A$  is incompressible in  $M$ . By surgery along an innermost circle of  $D \cap A$  one can eliminate all circle intersections of  $A \cap D$ . Since  $\partial(A \cap D)$  consists of two points,  $A \cap D$  is a single arc, which has endpoints on the same component of  $\partial A$ , hence it cuts off a disk  $D'$  from  $A$ . Assume without loss of generality that  $D' \cap F'$  is on  $F'_1$ . Let  $D''$  be the disk on  $D$  bounded by  $(A \cap D) \cup (B \cap D)$ , and let  $B_1 = B \cap F'_1$ . Then  $D' \cup D'' \cup B_1$  is a disk with boundary  $C_1$ , which contradicts the fact that  $C_1$  is not null-homotopic in  $M$ . Therefore,  $C'$  is not parallel into  $F$ .  $\square$

**Lemma 6.** *Suppose  $F'$  is incompressible, and is not a thrice punctured sphere. Then either (i) there is a  $\partial$ -nonseparating curve  $C'$  on  $F'$  which is not parallel into  $F$ , or (ii)  $F'$  is parallel into  $F$ .*

*Proof.* Since  $F'$  is not a thrice punctured sphere, one can easily find a  $\partial$ -nonseparating curve  $\alpha_0$  on  $F'$ . Assume that (i) is not true, so all  $\partial$ -nonseparating curves are parallel into  $F$ . We want to show that  $F'$  is parallel into  $F$ .

Since  $\alpha_0$  is parallel into  $F$ , the annulus  $N(\alpha_0)$  is also parallel into  $F$ . It is an incompressible annulus because  $\alpha_0$  is essential on  $F'$  and  $F'$  is incompressible. Among all connected incompressible surfaces in  $\text{Int}F'$  which contain  $\alpha_0$  and are parallel into  $F$ , choose  $G'$  such that the complexity  $(\chi(G'), |\partial G'|)$  is minimal in the lexicographic order, where  $\chi(G')$  is the Euler characteristic of  $G'$ , and  $|\partial G'|$  is the number of boundary components of  $G'$ . All incompressible sub-surfaces of  $F'$  have Euler characteristics bounded below by  $\chi(F')$ , hence such  $G'$  does exist.

If all boundary components of  $G'$  are parallel to some boundary components on  $F'$ , then either  $G'$  is contained in a collar of  $\partial F'$ , or  $F' - \text{Int}G' = \partial F' \times I$ . The first case does not happen because  $G'$  contains the  $\partial$ -nonseparating curve  $\alpha_0$ , which by definition is not parallel to any boundary curve on  $F'$ . In the second case  $F'$  is isotopic to  $G'$ , so it is parallel into  $F$ , and we are done. Hence we may assume that some boundary curve  $\beta$  of  $G'$  is not parallel to any boundary curve on  $F'$ .

We want to find a  $\partial$ -nonseparating curve  $\alpha'$  which intersects  $\beta$  essentially in one or two points. If  $\beta$  is nonseparating on  $F'$ , choose  $\alpha'$  to be any curve on  $F'$  that intersects  $\beta$  in a single point. Then  $\alpha'$  is nonseparating, hence  $\partial$ -nonseparating

on  $F'$ . If  $\beta$  separates  $F'$  into  $F'_1$  and  $F'_2$ , choose an essential arc  $\alpha'_i$  on  $F'_i$  with  $\partial\alpha'_1 = \partial\alpha'_2 \subset \beta$ . Moreover, if  $F'_i$  is nonplanar, choose  $\alpha'_i$  to be nonseparating on  $F'_i$ . Then  $\alpha' = \alpha'_1 \cup \alpha'_2$  is  $\partial$ -nonseparating, and intersects  $\beta$  essentially in two points, as required.

Isotope  $\alpha'$  so that it intersects  $\partial G'$  minimally. The geometric intersection number between  $\alpha'$  and  $\beta$  is 1 or 2, so  $\alpha' \cap \partial G' \neq \emptyset$ . Since  $\alpha'$  is  $\partial$ -nonseparating, by our assumption above it is parallel into  $F$ , so there is an annulus  $A$  with  $\partial A = \alpha' \cup \alpha$ , where  $\alpha \subset F$ . Isotope  $A$  rel  $\alpha'$  so that it intersects  $(\partial G') \times I$  minimally. Since  $G'$  is incompressible,  $(\partial G') \times I$  consists of incompressible annuli in  $M$ , hence  $A \cap ((\partial G') \times I)$  has no trivial circles. Since  $F$  and  $F'$  are also incompressible, one can show that  $A \cap ((\partial G') \times I)$  has no trivial arcs on  $A$  either. Therefore  $A \cap ((\partial G') \times I)$  consists of vertical arcs  $(\alpha' \cap \partial G') \times I$ . These arcs cut  $A$  into several squares  $\alpha'_i \times I$ , where each  $\alpha'_i$  is the closure of a component of  $\alpha' - \partial G'$ . Choose  $i$  so that  $\alpha'_i$  lies outside of  $G'$ . Let  $H$  be the component of  $F' - \text{Int}G'$  that contains  $\alpha'_i$ . Then  $G'' = G' \cup N(\alpha'_i)$  is a surface parallel into  $F$ , and  $\chi(G'') = \chi(G') - 1$ . The arc  $\alpha'_i$  is essential on  $H$ , so the only case that some boundary component  $\gamma$  of  $G''$  bounds a disk on  $F'$  is when  $H$  is an annulus, and  $\gamma$  is the boundary of the disk obtained by cutting  $H$  along  $\alpha'_i$ . Since  $F$  and  $F'$  are incompressible and  $M$  is irreducible, both ends of the annulus  $\gamma \times I \subset G'' \times I \subset M$  bound disks on  $F \cup F'$ , which together with  $\gamma \times I$  bounds a 3-ball in  $M$ . It follows that  $G' \cup H$  is parallel into  $F$ . Since  $G' \cup H$  has the same Euler characteristic as  $G'$  but fewer boundary components, this contradicts the choice of  $G'$ . Therefore  $\partial G''$  consists of essential curves on  $F'$ . Since  $F'$  is incompressible,  $G''$  is also incompressible. Since  $\chi(G'') < \chi(G')$ , this again contradicts the choice of  $G'$ .  $\square$

Given a simple closed curve  $\alpha$  and a proper arc  $\gamma$  on  $F'$ , denote by  $\tau_\alpha^n \gamma$  the curve obtained from  $\gamma$  by Dehn twisting  $n$  times along  $\alpha$ , and by  $N(\tau_\alpha^n \gamma)$  a regular neighborhood of  $\tau_\alpha^n \gamma$  on  $\partial M$ . Suppose  $T$  is a fixed torus boundary component of a 3-manifold  $M$ . Denote by  $M(r)$  the manifold obtained by Dehn filling on  $T$  along a slope  $r$  on  $T$ , that is  $M(r)$  is obtained by gluing a solid torus  $V$  to  $M$  along  $T$  so that the curve  $r$  on  $T$  bounds a meridian disk in  $V$ . Denote by  $\Delta(r_1, r_2)$  the minimal geometric intersection number between two slopes  $r_1, r_2$ . The following two theorems will be used in the proof of Theorem 9, which proves Theorem 1 in the case that  $F'$  contains a  $\partial$ -nonseparating curve which is not parallel into  $F$ .

**Lemma 7.** ([Wu2], Theorem 1) *Let  $T$  be a torus component on the boundary of a 3-manifold  $M$ , and let  $S$  be an incompressible surface on  $\partial M - T$ . Suppose there is no incompressible annulus in  $M$  with one boundary component on each of  $S$  and  $T$ . If  $S$  is compressible in  $M(r_1)$  and  $M(r_2)$ , then  $\Delta(r_1, r_2) \leq 1$ . In particular,  $S$  is incompressible in all but at most three  $M(r)$ .  $\square$*

**Lemma 8.** ([CGLS], Theorem 2.4.3) *Let  $T, S, M$  be as in Lemma 7, and assume further that  $M$  is irreducible. Suppose that there is an incompressible annulus  $A$  in  $M$  with one boundary component on  $S$  and the other a curve  $r_0$  on  $T$ . Then either  $S$  is a torus and  $M = S \times I$ , or  $S$  remains incompressible in all  $M(r)$  with  $\Delta(r, r_0) > 1$ .  $\square$*

**Theorem 9.** *Let  $\alpha$  be a  $\partial$ -nonseparating curve on  $F'$  which is not parallel into  $F$ , and let  $\gamma$  be a proper arc on  $F'$  intersecting  $\alpha$  in one point. Then  $F_n = F \cup N(\tau_\alpha^n \gamma)$  is incompressible for all but at most three consecutive  $n$ 's.*

*Proof.* Let  $K$  be the knot obtained by pushing  $\alpha$  slightly into  $M$ . There is an embedded annulus  $A_0$  in  $M$  with  $\partial A_0 = \alpha \cup K$ . Consider the manifold  $M_K = M - \text{Int}N(K)$ , where  $N(K)$  is a regular neighborhood of  $K$  in  $M$ . Let  $T$  be the torus  $\partial N(K)$ , and let  $(m, l)$  be the meridian-longitude pair on  $T$  such that  $l = A_0 \cap T$ . Denote by  $M_K(p/q)$  the manifold obtained by Dehn filling on  $T$  along the slope  $pm + ql$ . The Dehn twist  $\tau_\alpha^{-n}$  on  $F'$  extends to a Dehn twist of  $M_K$  along the annulus  $A = A_0 \cap M_K$ , which sends the meridian slope  $m$  of  $T$  to the slope  $m - nl$ , so it extends to a homeomorphism  $\varphi_n : M = M_K(1/0) \cong M_K(-1/n)$ , which maps the curve  $\tau_\alpha^n \gamma$  to the curve  $\gamma$ , and hence the surface  $F_n$  to the surface  $F_0 = F \cup N(\gamma)$ . It follows that  $\varphi_n$  is a homeomorphism of pairs

$$\varphi_n : (M, F_n) \rightarrow (M_K(-1/n), F_0).$$

Therefore to prove the theorem we need only show that for all but at most three consecutive integers  $n$ , the surface  $F_0$  is incompressible in  $M_K(-1/n)$ .

CLAIM 1.  $T = \partial N(K)$  is incompressible in  $M_K$ , and  $M_K$  is irreducible.

If  $D$  is a compressing disk of  $T$  in  $M_K$ , then  $\partial D$  must intersect the meridian  $m$  of  $K$  in one point, because otherwise after the trivial Dehn filling,  $M = M_K(1/0)$  would contain a lens space or  $S^2 \times S^1$  summand, contradicting the irreducibility of  $M$ . It follows that  $K$ , and hence  $\alpha$ , bounds a disk in  $M$ . In this case  $\alpha$  is parallel to a trivial curve on  $F$ , which contradicts the assumption that  $\alpha$  is not parallel into  $F$ . Similarly, if  $M_K$  is reducible, then since  $M$  is irreducible,  $K$  is contained in a ball in  $M$ , so  $\alpha$  would be null-homotopic. Using Dehn's Lemma, we see that  $\alpha$  bounds a disk in  $M$ , hence is parallel to a trivial circle in  $F$ , contradicting the assumption that  $\alpha$  is not parallel into  $F$ .

CLAIM 2.  $F_0$  is incompressible in  $M_K$ .

Recall that  $A$  denotes the annulus  $A_0 \cap M_K$ . Since  $\alpha$  intersects  $\gamma$  in a single point,  $A \cap F_0$  is a single arc  $C$  on the boundary curve  $\alpha$  of  $A$ . Let  $D$  be a compressing disk of  $F_0$ , chosen so that  $|D \cap A|$ , the number of components in  $D \cap A$ , is minimal. After disk swapping along disks on  $A$  bounded by innermost circles, we can assume that no component of  $D \cap A$  is a trivial circle on  $A$ . Since  $T$  is incompressible by Claim 1, the annulus  $A$  is also incompressible, so  $D \cap A$  contains no essential circle component on  $A$  either. Hence  $D \cap A$  consists of arcs only. If some arc  $e$  of  $D \cap A$  is parallel in  $A$  to a sub-arc on  $C = A \cap F_0$ , then after boundary compressing  $D$  along a disk  $\Delta$  cut off by an outermost such arc we will get two disks  $D_1, D_2$  with boundary on  $F_0$ , at least one of which has boundary an essential curve on  $F_0$ , hence is a compressing disk of  $F_0$ . Since  $|D_i \cap A| < |D \cap A|$ , this contradicts the minimality of  $|D \cap A|$ . Therefore, each arc of  $D \cap A$  is essential relative to  $C$ , in the sense that it is not parallel in  $A$  to an arc on  $C$ . See Figure 1(a). Notice that  $|D \cap A| \neq 0$ , otherwise  $D$  would be a compressing disk of  $F$ , contradicting the incompressibility of  $F$ .

Consider an outermost disk  $\Delta$  on  $D$ , as shown in Figure 1(b). Then  $\partial \Delta$  consists of two arcs  $e_1, e_2$ , where  $e_1$  is an arc on  $A$  which is essential relative to  $C$ , and  $e_2$  is an arc on  $F_0$  with interior disjoint from  $C$ . Thus  $e_2 \cap N(\gamma)$  consists of two arcs  $e'_2, e''_2$ . Let  $t_1$  be the subarc of  $C$  connecting the two ends of  $e'_2 \cup e''_2$  on  $C$ , and let  $t_2$  be the subarc on  $\partial N(\gamma)$  connecting the other two ends of  $e'_2 \cup e''_2$ . Then  $e'_2 \cup t_1 \cup e''_2 \cup t_2$  bounds a disk  $\Delta'$  on  $N(\gamma)$ . Now  $A' = \Delta \cup \Delta'$  is an annulus in  $M$ , with one boundary component  $e_1 \cup t_1$  an essential circle on  $A$ , which is parallel to  $\alpha$ , and the other component  $\widehat{e}_2 \cup t_2$  a curve on  $F$ , where  $\widehat{e}_2$  is the closure of  $e_2 - (e'_2 \cup e''_2)$ . This contradicts the assumption that  $\alpha$  is not parallel into  $F$ .

Figure 1

CLAIM 3. *There is no incompressible annulus  $P$  in  $M_K$  with one boundary component  $C_1$  on  $F_0$  and the other component  $C_2$  a curve on  $T$  which is disjoint from  $l = A \cap T$ .*

The proof is similar to that of Claim 2. Choose  $P$  so that  $|P \cap A|$  is minimal. Using the fact that  $P$  is incompressible, one can show as above that  $P \cap A$  has no trivial circle component. Note that since  $C_2$  is disjoint from  $l$ ,  $P \cap A$  has no arc component with endpoints on  $l = A \cap T$ . If  $P \cap A$  had some essential circle component, choose such a component  $t$  which is closest to  $l$  on  $A$ . By cutting and pasting along the annulus on  $A$  bounded by  $t \cup l$ , one would get another incompressible annulus  $P'$  which has fewer intersection components with  $A$ . As in the proof of Claim 2 one can eliminate all arc components of  $P \cap A$  which on  $A$  are inessential relative to  $C = A \cap F_0$ . Hence  $P \cap A$  consists of arcs with ends on  $C$  and are essential relative to  $C$ , as shown in Figure 1(a). Also, since  $P$  is disjoint from  $l$ ,  $P \cap A$  consists of inessential arcs on  $P$ . Now one can use a disk  $\Delta$  cut off by an outermost arc on  $P$ , proceed as in the proof of Claim 2 to get an annulus with one boundary on  $\alpha$  and the other on  $F$ , and get a contradiction. Finally, if  $P \cap A = \emptyset$  then  $P$  extends to an annulus with one boundary on  $\alpha$  and the other on  $F$ , contradicting the assumption that  $\alpha$  is not parallel into  $F$ . This completes the proof of Claim 3.

We now continue with the proof of Theorem 9. We have shown that  $F_0$  is incompressible in  $M_K$ . If there is no essential annulus in  $M_K$  with one boundary component on each of  $F_0$  and  $T$ , then by Lemma 7 we know that  $F_0$  is incompressible in  $M_K(r)$  for all but at most three slopes  $r$  with mutual intersection number 1. In particular, it is incompressible in  $M_K(-1/n)$  for all but at most two consecutive  $n$ 's, so the theorem follows. Now suppose there is an essential annulus  $P$  in  $M_K$  with one boundary component on  $F_0$  and the other a curve  $r_0$  on  $T$ . Since  $F_0$  is not a closed surface, it is not a torus. Hence by Lemma 8,  $F_0$  remains incompressible in  $M_K(-1/n)$  unless  $\Delta(-1/n, r_0) \leq 1$ . By Claim 3,  $r_0$  is not the longitude slope  $0/1$ , therefore,  $\Delta(-1/n, r_0) \leq 1$  holds for at most three consecutive integers  $n$ . This completes the proof of Theorem 9.  $\square$

*Proof of Theorem 1.* By Theorem 4, Lemmas 5 and 6, and Theorem 9, we can now assume that  $F'$  is incompressible and is parallel into  $F$ . We want to show that either  $F$  is arc-extendible in  $F'$ , or  $M$  is a product  $F \times I$ . As in the proof of Theorem 4, we may assume without loss of generality that  $M$  is a compression body, so all closed incompressible surfaces of  $M$  are boundary parallel. Let  $\alpha_1, \dots, \alpha_k$  be the boundary curves of  $F'$ . Let  $F' \times I$  be a product in  $M$  such that  $F' = F' \times 0$  and  $F' \times 1 \subset F$ . Write  $\alpha_i^1 = \alpha_i \times 1$ , which is a curve on  $F$  isotopic to  $\alpha_i$  in  $M$ .

We have assumed above that  $F'$  is incompressible in  $M$ , so  $\text{Int}F \cup \text{Int}F'$  is incompressible in  $M$ . Write  $\widehat{F}_i = \text{Int}F \cup \text{Int}F' \cup \alpha_i$ . If  $\widehat{F}_i$  is incompressible for some  $i$ , then  $F \cup N(\gamma)$  is incompressible for any essential arc  $\gamma$  in  $F'$  with endpoints on  $\alpha_i$ , and we are done. (Such an arc exists because  $F'$  is not an annulus or disk.) So assume that  $\widehat{F}_i$  is compressible for all  $i$ . By the Handle Addition Lemma (Lemma 2), after adding a 2-handle to  $M$  along  $\alpha_i$ , the surface  $\widehat{F}_i[\alpha_i]$  is incompressible, and  $M[\alpha_i]$  is irreducible. Notice that since  $F'$  is incompressible, the curve  $\alpha_i^1 = \alpha_i \times 1$  in  $F$  is essential on  $F$ . But after adding the 2-handle,  $\alpha_i^1$  bounds a disk in  $M[\alpha_i]$ , so it must also bound a disk on  $\widehat{F}_i[\alpha_i]$  because  $\widehat{F}_i[\alpha_i]$  is incompressible. By definition  $\widehat{F}_i[\alpha_i]$  is obtained from  $(\text{Int}F \cup \text{Int}F') - \text{Int}N(\alpha_i)$  by capping off the two copies of  $\alpha_i$  with disks, hence  $\alpha_i^1 \cup \alpha_i$  bounds an annulus  $A_i$  on  $\widehat{F}_i$ . Denote by  $A_i'$  the annulus  $\alpha_i \times I \subset F' \times I \subset M$ . Then  $T_i = A_i \cup A_i'$  is a torus in  $M$  ( $T_i$  cannot be a Klein bottle since  $M$  is a compression body). Since we have assumed above that  $M$  is a compression body, either (i)  $T_i$  bounds a solid torus  $V_i$ , or (ii) it is parallel to some torus component of  $\partial M$ , or (iii) it lies in a ball and bounds a cube with knotted hole. Since  $F'$  is incompressible, the curve  $\alpha_i$  is not null homotopic in  $M$ , hence (iii) does not happen. Since  $M[\alpha_i]$  is irreducible, one can proceed as in the proof of Theorem 4 to show that  $T_i$  must bound a solid torus  $V_i$  with  $\alpha_i$  a longitude. This is true for all  $i$ . It is now easy to see that  $M$  is a product  $F \times I$ .  $\square$

The following theorem supplements Theorem 1. It says that in most case there are extension arcs with endpoints on any prescribed boundary components of  $F'$ .

**Theorem 10.** *Let  $F, F', M$  be as in Theorem 1. Suppose  $M$  is not a product  $F \times I$ , and suppose  $F'$  is not parallel into  $F$  and is not a thrice punctured sphere. Then it contains an extension arc  $\gamma$  of  $F$  with endpoints on any prescribed components of  $\partial F'$ .*

*Proof.* We need to find a curve  $\alpha$  on  $F'$  which is not parallel into  $F$ . If  $F'$  is nonplanar, then by the proof of Lemmas 5 and 6, we can find such an  $\alpha$  (denoted by  $C'$  there) on  $F'$  which is actually nonseparating on  $F'$ . Hence given any boundary components  $\partial_1, \partial_2$  of  $F'$ , (possibly  $\partial_1 = \partial_2$ ), there is an arc  $\gamma$  with endpoints on  $\partial_1$  and  $\partial_2$ , intersecting  $\alpha$  in one point. By Theorem 9, for all but at most three integers  $n$ , the arc  $\gamma_n = \tau_\alpha^n \gamma$  is an extension arc of  $F$ .

Now suppose  $F'$  is planar with  $|\partial F'| \geq 4$ . First assume that  $\partial_1, \partial_2$  are distinct boundary components of  $F'$ . By the proof of Lemmas 5 and 6, there is a curve  $\alpha$  which is a band sum of two boundary components of  $F'$ , such that  $\alpha$  is not parallel into  $F$ . From the proofs one can see that we can always choose  $\alpha$  to be the band sum of  $\partial_1$  and  $\partial_3$ , with  $\partial_3 \neq \partial_1, \partial_2$ . Hence there is an arc  $\gamma$  from  $\partial_1$  to  $\partial_2$  intersecting  $\alpha$  in one point. We can then apply Theorem 9 to get an extension arc  $\gamma_n$  with one endpoint on each of  $\partial_1$  and  $\partial_2$ .

We now proceed to find an extension arc in  $F'$  with boundary on the same component  $\partial_1$  of  $\partial F'$ . By the proof of Lemmas 5 and 6, we can choose the curve

Figure 2

$\alpha$  above to be the band sum of  $\partial_2$  and  $\partial_3$ , with  $\partial_1 \neq \partial_2, \partial_3$ . Recall that  $\alpha$  is not parallel into  $F$ . Choose an arc  $\gamma$  as follows. Let  $\partial'_2$  be a curve on  $F'$  parallel to  $\partial_2$ , let  $\gamma'$  be an arc connecting  $\partial'_2$  to  $\partial_1$  intersecting  $\alpha$  in one point, and let  $Q$  be the sub-surface  $N(\gamma' \cup \partial'_2)$  of  $F'$ . Then  $\gamma$  is the closure of the arc component of  $\partial Q \cap \text{Int} F'$ , that is,  $\gamma$  is the arc component of the frontier of  $Q$  in  $F'$ , see Figure 2 below. Consider the surface  $F_0 = F \cup N(\gamma)$ , and observe that  $F_0$  is isotopic to the surface  $F \cup Q$ . After Dehn twisting along  $\alpha$ , it is isotopic to the surface  $F \cup N(\tau_\alpha^n \gamma)$ ; hence to show that all but at most three  $\tau_\alpha^n \gamma$  are extension arcs of  $F$  in  $F'$ , we need only show that  $F \cup Q$  is incompressible after all but at most three Dehn twists along  $\alpha$ . Since  $F \cup Q$  intersects  $\alpha$  in a single arc, the argument in the proof of Theorem 9 is still valid, with the following easy modifications. We use the notations in that proof.

The proof of Claim 2 needs the following modifications. (i) The arc  $e_2$  on the boundary of the outermost disk  $\Delta$  may be on  $Q$ . In this case, notice that the other arc  $e_1$  on  $\partial\Delta$  is isotopic to an arc  $\alpha_1$  on  $\alpha$ , and  $e_2 \cup \alpha_1$  is isotopic in  $F'$  to the curve  $\partial_3$ , so the fact that  $e_1 \cup e_2$  bounds a disk  $\Delta$  would imply that  $\partial_3$  bounds a disk. Since  $\partial_3$  is also on  $\partial F$ , this contradicts the fact that  $F$  is incompressible and diskless. (ii) The compressing disk  $D$  of  $F \cup Q$  could be disjoint from the annulus  $A$ . But since  $F$  is incompressible, this would imply that  $\partial D$  lies on  $Q$ , hence is isotopic to  $\partial_2$ , which would imply that  $\partial_2$  bounds a disk, again contradicting the assumption that  $F$  is incompressible and diskless.

The proof of Claim 3 applies to show that the annulus  $P$  there can be modified to be disjoint from the annulus  $A$ . Then notice that the component of  $\partial P$  on  $F \cup Q$  is either in  $F$ , or in  $Q$  and hence parallel to  $\partial_2$ . Since  $\partial_2 \subset F$ , in either case  $P$  can be extended to an annulus with one boundary component on  $\alpha$  and the other on  $F$ , which contradicts the assumption that  $\alpha$  is not parallel into  $F$ .

The rest of the proof of Theorem 9 follows verbatim to show that  $F \cup Q$  is incompressible after all but at most three Dehn twists along  $\alpha$ .  $\square$

*Remark.* Theorem 10 is not true if  $F'$  is a thrice punctured sphere.
